## 1. Introduction

Researchers investigating progression to higher education (HE) have suggested that student and school characteristics (e.g., gender, prior academic attainment, social background, type of school) are important factors affecting HE participation and the type of HE institution attended (Chowdry et al., 2013; Boliver, 2013; Vidal Rodeiro, Sutch, \& Zanini, 2015). This is in part because certain types of qualifications and/or subjects that are good preparation for HE tend to be taken by young people with higher academic attainment, which is related to social background and to the choices available in their schools (Vidal Rodeiro, 2007; Dilnot, 2016; Gill, 2017).
However, over the past few years, policy makers and the general public in England have become increasingly concerned about the extent to which different qualifications and subjects prepare young people for careers or further study. Despite policy efforts and claims of "equivalence", multiple studies have identified ways in which the progression of young people differs depending on the qualifications and/or subjects studied, even after controlling for their background characteristics (Smith, Joslin, \& Jameson, 2015; Vidal Rodeiro, Sutch, \& Zanini, 2015; Hupkau et al., 2017; Dilnot, 2018; Vidal Rodeiro \& Williamson, 2018).
In England, the principal measure of academic attainment for 18 year-old pre-university students is the A Level. In recent years, over 80 different subjects have been offered at A Level. Students can decide which and how many of those subjects they wish to study depending on, for example, their career aspirations, their academic ability, the provision at their school/college or the advice given to them. Students aiming for university typically study three or four subjects at A Level. For example, in 2015, 73 per cent of the 18 year-olds applying to UK HE institutions did so with just A Levels (UCAS, 2016).
Choosing A Levels, however, is not straightforward as some subjects might be seen as providing better grounding for university courses than others. Furthermore, many HE courses require particular subjects and there is also a disparity in the attitudes of HE admissions staff towards certain A Levels. The latter is shown by the gulf in uptake of some subjects among students at prestigious HE institutions, compared to the national uptake or to the uptake in other types of institutions. For example, Vidal Rodeiro and Sutch (2013) showed that Mathematics was taken by over half of the accepted applicants to Russell Group ${ }^{1}$ universities but by just over 15 per cent of the accepted applicants to universities in the MillionPlus group ${ }^{2}$. On the contrary, uptake of more applied subjects (e.g., Design \& Technology, Art \& Design, Business Studies or Media Studies) was much higher amongst students in MillionPlus group universities than amongst students in universities of the Russell Group.
Individual institutions have their own lists of "preferred" subjects, some of which are more open than others. For example, the Russell Group has, since 2011, published an annual guide to A Level choice known as Informed Choices (Russell Group, 2017). In this guide, they advised students to study at least two from a list of "facilitating subjects", which would leave their options open for a variety of courses. However, they acknowledged that this advice would not apply to all students, and those who were definitely intending to study certain specialist courses such as Music would be best served otherwise. Outside the Russell Group, there is less information available to prospective applicants to guide subject choices, and data on HE entry requirements by institution is not usually available.

[^0]As progression to HE continues to be a matter of interest, not just from a research point of view but also for students, HE institutions, awarding bodies and policy makers, a better understanding of how A Level subjects are used to access HE (and different types of HE institutions) is important. The main aim of this research was, therefore, to investigate:

- the proportions of students who hold different A Level subjects (or combinations of A Level subjects) when applying for a place at a HE institution ${ }^{3}$;
- the performance in different A Levels amongst the students applying for a place at a HE institution; and
- how students' backgrounds interact with the choice of A Level subjects to influence the type of HE institution attended.

[^1]
## 2. Data and methodology

### 2.1 Data

This study followed a full cohort of Year 13 (2015/16) students in schools/colleges in England through the first year of their HE studies (2016/17). In order to do so, data from two different sources was used:

- National Pupil Database (NPD)

The NPD extracts had information, for the academic year 2015/16, on:

- A Level qualifications and attainment;
- prior attainment (e.g., GCSE (General Certificate of Secondary Education) and other qualifications taken at Key Stage 4); and
- students' characteristics such as gender, type of school attended and deprivation.
- Higher Education Statistics Agency (HESA)

The data from the HESA covered all full-time, first-year undergraduates. Data was linked to the NPD extract described above using a unique student identifier. In particular, the HESA data included:

- level of study (e.g., first degree, foundation degree, HND/HNC ${ }^{4}$, other);
- information about whether a student's parents have HE qualifications;
- subject of HE course; and
- HE institution.

The students in this research were 17 or 18 years-old at the beginning of the academic year 2015/16 and achieved at least one A Level, graded A*-E. All A Levels achieved by these students, independent of the year in which they certificated, were included in the analyses. Note that AS Levels were not considered in this study. The size of this A Level cohort was 276,7055.
Just below 160,000 students in the above A Level cohort $(159,790)$ appeared in the HESA student records for the academic year 2016/17. The 116,910 A Level students who were not in the HESA data (that is, 42 per cent of the A Level cohort) might not have applied to study in a HE institution, they might not have been offered a place at a HE institution, or they might have taken a gap year ${ }^{6}$. It is also worth noting at this point that the linking between NPD and HESA data is done by name, date of birth and postcode, and so some A Level students might have been lost in the matching process.

### 2.2 Method

In a first step, the research used descriptive statistics to investigate the following:
a) the uptake of $A$ Level subjects, and combinations of $A$ Level subjects, among students who started a HE course in the academic year 2016/17;
b) the comparison of the uptake of A Level subjects, and combinations of A Level subjects, between students starting a HE course and the national A Level cohort;

[^2]c) the performance in the most popular A Level subjects, and in combinations of $A$ Level subjects, among students who started a HE course in the academic year 2016/17; and
d) the comparison of performance in the most popular A Level subjects, and in combinations of A Level subjects, between students starting a HE course and the national A Level cohort.

Breakdowns by students' characteristics (gender, prior attainment, type of school, level of deprivation), HE institution and degree subject area were included in these descriptive analyses.

As mentioned in Section 2.1 above, data on students' characteristics and performance at Key Stage 4 (prior attainment) and at A Level was obtained from the NPD. In particular:

- Prior attainment was measured by the average GCSE and equivalent point score per entry ${ }^{7}$. For some of the analyses in this report, this measure was used to divide students into three approximately equally sized groups: low, medium or high prior attainment.
- A Level performance was measured by the percentages of students achieving specific grades in each A Level subject, by the percentage of students achieving AAB grades, by the number of $A^{*} / A$ grades achieved in facilitating ${ }^{8}$ subjects, by the percentage of students who achieved AAB including two facilitating subjects, and by the A Level points ${ }^{9}$ in the best (up to) three A Levels.
- Schools were classified in two groups: independent schools and state-maintained centres (the latter includes academies, comprehensive schools, grammar schools, secondary modern schools, sixth form colleges and further education centres).
- The income related level of deprivation that a student experiences was inferred using a government index based on the home postcode. The Income Deprivation Affecting Children Index (IDACI) measures the proportion of children in the immediate neighbourhood living in low income families ${ }^{10}$. It varies between 0 and 1 and indicates how income deprived the area is that they live in (although it cannot tell us how income deprived the student actually is). This measure was used to divide students into three approximately equally sized groups: living in areas of low (more affluent), medium or high deprivation.

Different combinations of A Level subjects were used in the analyses carried out in this report. Firstly, the most popular combinations of A Level subjects were considered. Secondly, A Levels were classified as "facilitating", "useful", "more limited suitability", "less effective preparation" and "non-counting", as described in Dilnot (2018) and as "facilitating" and "non-facilitating" as suggested in Russell Group (2017). Finally, A Levels were classified using content-based groups (e.g., applied; expressive; Humanities; Languages; STEM ${ }^{11}$ ) as shown in Bramley (2014).

[^3]Using the A Level taxonomy based on subject content (Bramley, 2014), A Level students were assigned to an A Level specialism. In order to do so, the number of A Levels that each student had in each category was calculated. For students with three or more A Levels, the following rules were used:

- If more than half of a student's A Levels were in one category, they were assigned to that category (they must have at least two A Levels in the category, as these are students with at least three A Levels).
- If they did not have two A Levels in any single category, they are not specialists so they were assigned to the "None" category.
- If the student had two subjects in exactly one category but this did not form the majority (for example they took four A Levels, spread across categories in the configuration $2+1+1$ ), they were assigned to that category.
- If the student had two subjects in at least two categories, they were assigned to the "Multiple" category.
Students with fewer than three A Levels were assigned to the "None" category.
Previous studies carried out in the Research Division of Cambridge Assessment that included analyses looking at the HE institution attended (Vidal Rodeiro \& Sutch, 2013; Gill \& Vidal Rodeiro, 2014; Vidal Rodeiro, Sutch, \& Zanini, 2015; Sutch, Zanini, \& Vidal Rodeiro, 2016; Gill, Vidal Rodeiro, \& Zanini, 2018) have considered HE institutions in mission groups. Institutions in the same mission group have similar origins and ethos and share interests and procedures (e.g., Russell Group, University Alliance, MillionPlus Group, Guild HE). However, in this work, different classifications of the HE institutions were explored and used. In particular:
- HE institutions were considered in two groups: Russell Group and "Other" universities. The Russell Group ${ }^{12}$ consists of research-intensive and highly selective institutions. The other group is constituted by newer universities and colleges, which are usually recruiting institutions or universities with former "polytechnic" status.
- HE institutions were also classified as being (or not) in the Sutton Trust Top-30 most selective universities. The universities in the Sutton Trust Top-30 group are researchintensive and regarded as some of the UK's prestigious, elite and most selective institutions ${ }^{13}$.
- The Complete University Guide ${ }^{14}$ produces the most comprehensive independent rankings of the UK's HE institutions. The main league table measures institutions by ten indicators (e.g., student satisfaction; student-staff ratio; research quality; degree completion; graduation prospects), reports an overall ranking and ranks by each of the indicators. In this research, the overall ranking and the rankings by student satisfaction, research quality and graduate prospects were considered to group the HE institutions. Each of the measures were used to divide institutions into three approximately equally sized groups ${ }^{15}$ : low, medium or high ranking.

[^4]The subject of study at university was provided in a list of 19 broad degree areas, which related to the principal subject of the student's qualification aim. These were: Agriculture and related subjects; Architecture, Building and Planning; Biological Sciences; Business and Administrative Studies; Creative Arts and Design; Education; Engineering and Technology; Languages; Historical and Philosophical Studies; Law; Mass Communications and Documentation; Mathematical Sciences; Medicine and Dentistry; Computer Science; Combined; Physical Sciences; Social Studies; Subjects allied to Medicine; Veterinary Sciences.
The relationship between enrolment in HE and A Level subject uptake has also been investigated using regression analyses. In particular, multilevel logistic regression analyses were carried out in order to look at the relationship between enrolment in HE and A Level specialism, controlling for background variables including performance at A Level and students' characteristics derived from the data (e.g., gender; prior attainment; previous institution type; socio-economic background ${ }^{16}$ ).

Logistic regression is a type of regression analysis that is used when the dependent variable or outcome is a dichotomous variable (i.e., it takes only two values, which usually represent the occurrence or non-occurrence of some event) and the independent variables are continuous, categorical, or both. It is used to model the probability that the event of interest will occur as a function of the independent variables (see, for example, Hosmer \& Lemeshow, 2000).
A multilevel model was proposed due to the hierarchical (or multilevel) structure of the data. If we failed to recognise this hierarchical structure, then the standard errors of the regression coefficients would be underestimated, leading to an overstatement of the statistical significance.
For the purpose of the analyses presented in this report, the dependent variable for the regression models was the students' enrolment in HE.
Generally, the models considered in this report took the following form:

$$
\log \left(\frac{p_{i j}}{1-p_{i j}}\right)=\beta_{0}+\beta_{1} I V 1_{i j}+\beta_{2} I V 2_{i j}+\cdots+\beta_{l} I V l_{i j}+u_{j}
$$

where $p_{i j}$ is the probability of student $i$ in institution $j$ of enrolling in HE, IV1 to $I V l$ are the independent variables, $\beta_{0}$ to $\beta_{l}$ are the regression coefficients and $u_{j}$ is random variable at school level.

A detailed breakdown of the dependent and independent variables included in the multilevel logistic models is presented in Table 1.

[^5]Table 1: Description of the variables included in the multilevel logistic regression models

|  | Name | Description | Range of values | Main model | Different HEls models |
| :---: | :---: | :---: | :---: | :---: | :---: |
|  | Students' enrolment in HE | Indicator of enrolment in HE | Discrete variable: 0 did not enrol in HE; 1 enrolled in HE | $\checkmark$ |  |
|  | Students' enrolment at different types of HE institutions | Indicator of enrolment at different types of HE institutions | Discrete variable: 0 did not enrol at particular HE type; 1 enrolled in at particular HE type |  | $\checkmark$ |
|  | Gender | Gender of the student | Discrete variable: male; female | $\checkmark$ | $\checkmark$ |
|  | Level of deprivation | Student's level of deprivation based on the IDACI | Discrete variable: low; medium; high | $\checkmark$ | $\checkmark$ |
|  | Type of school | Type of institution the student attended prior to HE | Discrete variable: state; independent | $\checkmark$ | $\checkmark$ |
|  | Parental education | Indicator of whether a student's parents have HE qualifications | Discrete variable: 1 if the student's parents have HE qualifications; 0 otherwise |  | $\checkmark$ |
|  | Prior attainment | Average GCSE and equivalent point score per entry | Continuous variable: ranges from 0 to 67.5. | $\checkmark$ | $\checkmark$ |
|  | Performance at A Level | Points in best (up to) three A Levels divided by 3 | Continuous variable: ranges from 0 to 60. | $\checkmark$ | $\checkmark$ |
|  | A Level specialism | A Level subject specialism | Discrete variable: none; applied; expressive; Humanities; Languages; STEM; multiple | $\checkmark$ | $\checkmark$ |
|  | Number of A Level subjects | Indicator variables of whether students: gained one, two, three, four, and five or more A Levels. | Discrete variables ( 5 variables): 1 if the student gained the number of A Levels; 0 otherwise | $\checkmark$ | $\checkmark$ |
|  | Number of A Levels in facilitating subjects | Indicator variables of whether students: gained zero, one, two, three, and four or more A Levels in facilitating subjects. | Discrete variables ( 5 variables): 1 if the student gained the number of A Levels in facilitating subjects; 0 otherwise | $\checkmark$ | $\checkmark$ |

## 3. Results ${ }^{17}$

### 3.1 Uptake of A Level subjects

This section of the report investigated the uptake of individual A Level subjects, and combinations of A Level subjects, amongst students who started a HE course in the academic year 2016/17. A comparison of the uptake of A Level subjects, and combinations of A Level subjects, between students starting HE and the national A Level cohort was also carried out.
Breakdowns by type of HE institution and degree subject area are reported here too. Breakdowns by students' characteristics (e.g., gender, prior attainment, type of school, level of deprivation) are reported in Appendix A.
Individual A Level subjects
Table 2 shows the uptake of individual A Level subjects for students starting HE courses in the 2016/17 academic year and it compares that to the uptake of these subjects by the national A Level cohort in 2015/16. Only the subjects taken by at least $1 \%$ of the A Level cohort are included in the table. For example, Mathematics, the most popular A Level subject overall ( $27.4 \%$ of the A Level cohort), was taken by $30.8 \%$ of the university students and by $22.7 \%$ of non-university students.
The most popular subjects amongst university students, following Mathematics, were Psychology, Biology, History, Chemistry and English Literature. It should be noted that the order of the subjects by their popularity was fairly similar in all three groups of students.

The percentages of students holding STEM subjects at A Level was higher amongst university students than amongst all A Level students (and non-university students ${ }^{18}$ ). This pattern was also similar in most Humanities subjects but reversed in subjects such as Business Studies, Media/Film/TV Studies, Drama \& Theatre Studies, Physical Education, Art \& Design, Music, and Design \& Technology.
Table 2 also shows that over $71 \%$ of the students with an A Level in Further Mathematics enrolled in HE and that around $65 \%$ of those with A Levels in Science subjects (Chemistry, Physics, Biology) and in Mathematics started a HE course following completion of Key Stage 5. On the other hand, fewer than $50 \%$ of students with A Levels in Art \& Design or in Film Studies enrolled in HE.

The uptake of individual A Level subjects is presented and broken down by university type in Table 3. This table shows, for example, that Mathematics was taken by $48.2 \%$ of the students in Russell Group universities, $67.4 \%$ of the students in the universities of Cambridge or Oxford, and $47.5 \%$ of the students in universities included the Sutton Trust Top-30 group. Table 3 also shows that students in Cambridge and Oxford universities held in higher proportions A Levels in other STEM subjects (e.g., Biology, Chemistry, Physics, Further Mathematics) and in Foreign Languages (e.g., French, German, Spanish) than students in other universities. There was also variation in the uptake between university groups of more applied subjects (e.g., Design \& Technology, Art \& Design, Business Studies, ICT, Media Studies) or Humanities (e.g., Psychology, Sociology). Overall, higher proportions of students not in Russell Group, Oxbridge and the Sutton Trust Top-30 group universities held A Levels in those subjects than students in such institutions.

[^6]Table 4 presents, in an alternative way, the uptake of individual A Levels subjects by each university type. Specifically, for each A Level subject, the percentage of students (out of those who enrolled in a HE course) who went to each type of university was calculated. For example, around 10 per cent of the students who obtained an A Level in French enrolled in Oxford or Cambridge. Similarly, one in seven (almost 14 per cent) of those with an A Level in Further Mathematics enrolled in Oxford or Cambridge.
The uptake of individual A Level subjects is presented, broken down by university rankings in Table 5-1 and Table 5-2. There was variation on the popularity of the A Level subjects by the different university rankings. For example, Table $5-1$ and Table 5-2 show that STEM subjects (e.g., Biology, Chemistry, Physics and Mathematics) were more popular amongst students in institutions of high research quality and high graduation prospects than in institutions with lower rankings in these areas. However, Biology and Chemistry were more popular amongst students in institutions of low student satisfaction than in institutions rated high by their students. The opposite patterns were found in subjects such as Physical Education or Law.
In the same way as Table 4 does, Table 6 and Table 7 present the percentage of students (out of those who enrolled in HE ) who were in high rank universities and in low rank universities, respectively. These tables show that there were differences between the uptake patterns in institutions ranked higher overall and ranked higher by student satisfaction or graduation prospects. For example, Table 7 shows that just over $36 \%$ of students with an A Level in Art \& Design enrolled in an institution with a low rank for graduation prospects. However, this figure is $23 \%$ for an institution with a low rank overall. Similarly, Table 6 shows that between $70 \%$ and $75 \%$ of the students with Modern Foreign Languages went to institutions with a high rank overall, but the percentages attending institutions ranked high for graduation prospects were around $5 \%$ lower.

Table 2: Uptake of individual A Level subjects (ordered by decreasing percentage of students with the subject enrolled in HE)

| A Level subject | $\begin{gathered} \text { All } \\ \text { students } \\ (\mathrm{N}=276,705) \end{gathered}$ | $\begin{aligned} & \text { University } \\ & \text { students } \\ & (\mathrm{N}=159,790) \end{aligned}$ | $\begin{gathered} \text { Non-University } \\ \text { students }{ }^{18} \\ (\mathrm{~N}=116,910) \end{gathered}$ | Difference | Students with the subject who enrolled in HE |

Table 8-1 to Table 8-4, presenting the uptake of individual A Level subjects by degree subject area, show, for example, that Mathematics was taken by $99.5 \%$ of the candidates accepted to pursue a degree in "Mathematical Sciences", $28.9 \%$ of the candidates accepted to "Subjects allied to Medicine" degrees and by only $10.4 \%$ of the candidates accepted to study "Languages". On the other hand, Business Studies was taken by only $38.5 \%$ of the students accepted to study a degree in "Business and Administrative Studies" and French or Spanish were taken only by $14.1 \%$ and $11.1 \%$, respectively, of the students enrolled in a "Language" degree ${ }^{19}$.

[^7]Table 8-1: Uptake of individual A Level subjects, by degree subject area (ordered by decreasing overall uptake of the A Level subject)

| A Level subject | Agriculture \& related subjects ( $\mathrm{N}=780$ ) | Architecture, Building \& Planning ( $\mathrm{N}=2,580$ ) | Biological Sciences ( $\mathrm{N}=18,715$ ) | Business \& Administrative Studies ( $\mathrm{N}=11,930$ ) | $\begin{aligned} & \text { Combined } \\ & (\mathrm{N}=26,815) \end{aligned}$ |

## Combinations of A Level subjects

The tables presented in this section of the report show which combinations of A Level subjects were most commonly held by undergraduates in UK HE institutions in the academic year 2016/17.
Table 9 shows the number of A Level subjects held by students. Just over 72 per cent of the A Level cohort had three or more A Levels, but this proportion was higher among students who were accepted onto a university course ( 79 per cent). Note that some students may have held other qualifications in addition to A Levels, such as BTEC, Cambridge National, or Extended Project qualifications. This was likely to be the case for students who held only one A Level, for example.

Table 9: Number of A Level subjects

| Number of <br> subjects | A Level <br> cohort <br> $(\mathbf{N}=\mathbf{2 7 6 , 7 0 5})$ | University <br> students <br> $(\mathbf{N}=\mathbf{1 5 9 , 7 9 0})$ | Non-University <br> students <br> $(\mathbf{N}=\mathbf{1 1 6 , 9 1 0})$ |
| :---: | :---: | :---: | :---: |
| 1 | 12.32 | 7.74 | 18.58 |
| 2 | 15.98 | 13.07 | 19.96 |
| 3 | 62.47 | 68.38 | 54.40 |
| 4 | 8.51 | 9.99 | 6.49 |
| $5+$ | 0.72 | 0.82 | 0.57 |
| Average | 2.70 | 2.83 | 2.50 |

Table 10 to Table 11-2 break down the number of A Level subjects held by students accepted onto a university course, by type of HE institution. There is considerable variation across the groups, with students attending Oxford or Cambridge holding the highest number of A Level subjects ( 3.52 on average) and those attending low ranking (overall) institutions the lowest (2.53).

Table 10: Number of A Level subjects, by type of HE institution

| Number of <br> subjects | Russell <br> Group <br> $(\mathbf{N}=\mathbf{5 1 , 8 7 0})$ | Oxbridge <br> $\mathbf{( N = 3 , 9 2 0 )}$ | Sutton Trust <br> Top-30 <br> $\mathbf{( N = 6 0 , 5 0 0 )}$ |
| :---: | :---: | :---: | :---: |
| 1 | 1.61 | 1.1 | 1.86 |
| 2 | 3.94 | 2.58 | 4.29 |
| 3 | 74.46 | 47.84 | 74.67 |
| 4 | 18.03 | 41.31 | 17.38 |
| $5+$ | 1.95 | 7.17 | 1.8 |
| Average | 3.15 | 3.52 | 3.13 |

Table 11-1: Number of A Level subjects, by ranking of the HE institution

| Number of <br> subjects | Overall Ranking |  |  | Student Satisfaction |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | Low <br> $(\mathbf{N}=\mathbf{2 9 , 6 7 0})$ | Medium <br> $(\mathbf{N}=\mathbf{4 9 , 8 3 0})$ | High <br> $(\mathbf{N}=\mathbf{7 7 , 5 6 5 )}$ | Low <br> $(\mathbf{N}=\mathbf{4 1 , 0 9 5})$ | Medium <br> $(\mathbf{N}=\mathbf{6 0 , 3 4 0})$ | High <br> $(\mathbf{N}=\mathbf{5 5 , 6 3 0})$ |
| 1 | 14.55 | 11.24 | 2.60 | 9.44 | 7.24 | 6.62 |
| 2 | 22.59 | 18.71 | 5.45 | 14.92 | 12.40 | 11.94 |
| 3 | 58.75 | 64.27 | 75.09 | 65.61 | 69.96 | 69.25 |
| 4 | 3.98 | 5.61 | 15.33 | 9.19 | 9.64 | 11.29 |
| $5+$ | 0.11 | 0.17 | 1.53 | 0.83 | 0.76 | 0.89 |
| Average | 2.53 | 2.64 | 3.08 | 2.77 | 2.84 | 2.88 |

Table 11-2: Number of A Level subjects, by ranking of the HE institution

| Number of <br> subjects | Research Quality |  |  | Graduation Prospects |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | Low <br> $(\mathbf{N}=\mathbf{2 9 , 6 8 0})$ | Medium <br> $(\mathbf{N}=\mathbf{5 7 , 6 7 0})$ | High <br> $(\mathbf{N}=\mathbf{6 9 , 3 2 0})$ | Low <br> $(\mathbf{N}=\mathbf{3 4 , 7 2 0})$ | Medium <br> $(\mathbf{N}=\mathbf{4 9 , 9 8 5})$ | High <br> $(\mathbf{N}=\mathbf{7 2 , 3 6 0})$ |
| 1 | 14.24 | 10.57 | 2.24 | 13.78 | 9.50 | 3.32 |
| 2 | 22.60 | 17.35 | 4.95 | 21.73 | 16.45 | 6.20 |
| 3 | 58.68 | 66.10 | 74.97 | 59.96 | 67.22 | 73.64 |
| 4 | 4.37 | 5.78 | 16.19 | 4.40 | 6.58 | 15.28 |
| $5+$ | 0.11 | 0.20 | 1.66 | 0.13 | 0.25 | 1.56 |
| Average | 2.54 | 2.68 | 3.10 | 2.55 | 2.71 | 3.06 |

Table 12 shows the number of facilitating subjects, as defined in Russell Group (2017), held by students. The Russell Group recommends that students take at least two facilitating subjects at A Level in order to keep most options for degree subject choice open (although they caution that some degrees, such as Music or Art, will require non-facilitating subjects to be chosen at A Level). On average, students (including those accepted at university) held A Levels in fewer than two facilitating subjects.

Table 12: Number of A Level facilitating subjects (as defined by the Russell Group)

| Number of <br> subjects | A Level <br> cohort <br> $(\mathbf{N}=\mathbf{2 7 6 , 7 0 5})$ | University <br> students <br> $(\mathbf{N}=159,790)$ | Non-University <br> students <br> $(\mathbf{N}=11,6910)$ |
| :---: | :---: | :---: | :---: |
| 0 | 29.08 | 24.30 | 35.62 |
| 1 | 29.53 | 28.61 | 30.77 |
| 2 | 22.60 | 24.87 | 19.49 |
| 3 | 16.12 | 19.07 | 12.09 |
| 4 | 2.50 | 2.99 | 1.83 |
| $5+$ | 0.17 | 0.16 | 0.19 |
| Average | 1.34 | 1.48 | 1.14 |

Table 13 to Table 14-2 show the breakdown of the number of $A$ Level facilitating subjects held by students accepted onto a university course, by type of HE institution. There is considerable variation across the groups, with students attending Oxford or Cambridge holding the highest number of facilitating subjects (2.95 on average) and those attending low ranking (overall) institutions, institutions with a low research quality ranking, or institutions with low graduation prospects the lowest ( $0.90,0.87,088$, respectively).

Dilnot (2018) devised a taxonomy of A Level subjects that provides a useful starting point for the analysis of the role of subject choice in university application. The categories in her taxonomy are as follows: facilitating (these are the same A Level subjects identified in the Informed Choices report (Russell Group, 2017); useful; more limited suitability (MLS); less effective preparation (LEP); and non-counting. The A Level subjects included in each category are listed in Appendix B, and the number of A Levels in each category held by the A Level students considered in this research is shown in Table 15. Table 16 and Table 17 show the breakdowns by type of HE institution and overall ranking, respectively.
Table 15 shows that the percentage of students with two or more facilitating or useful subjects was higher amongst university students than amongst non-university students. As expected, the percentages of students with two or more less suitable or non-counting A Level subjects was highest amongst students not enrolled in HE.

There was considerable variation across the different types of HE institutions. For example, Table 16 shows that the percentage of students having four or more facilitating subjects was highest at Oxford and Cambridge (e.g., 30.2 per cent, compared with 7.9 per cent of the students in Russell Group universities).
Table 17 shows that the number of A Levels in facilitating subjects increased with the increasing overall ranking of the HE institution, the number of less suitable A Levels decreased and the number of useful A Levels remained similar.

Table 15: Number of A Level subjects, by the A Level taxonomy proposed by Dilnot (2018)

|  | Type of A Level subjects | Number of A Level subjects |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  |  | 0 | 1 | 2 | 3 | 4+ | Average |

Table 16: Number of A Level subjects, by the A Level taxonomy proposed by Dilnot (2018) and type of HE institution

Table 17: Number of A Level subjects, by the A Level taxonomy proposed by Dilnot (2018) and overall ranking of HE institution

In this research, A Levels were also classified based on content, as shown in Bramley (2014). The categories in this taxonomy are as follows: STEM; Humanities; Languages; applied; and expressive. Details about the subjects included in each category and on how the different categorisations were devised are given in Appendix B. The number of A Levels in each category held by the A Level students considered in this research is shown in Table 18.

Table 18 shows, for example, that 56.7 per cent of the A Level cohort did not achieve an A Level in a STEM subject. This percentage was higher amongst non-university students. The percentages of students with at least one subject in the Languages area were around 10 per cent and this was similar for university and non-university students. Humanities, applied and expressive subjects were slightly more popular amongst non-university students than amongst university students.

Table 19 and Table 20 show the breakdowns by type of HE institution and overall ranking, respectively.

Table 18: Number of A Level subjects, by the A Level taxonomy based on subject content

Table 19: Number of A Level subjects, by the A Level taxonomy based on subject content and type of HE institution

|  | Type of A Level subjects | Number of A Level subjects (\% of students) |  |  |  |  |  |

Table 20: Number of A Level subjects, by the A Level taxonomy based on subject content and overall ranking of HE institution

Using the A Level taxonomy based on subject content (Bramley, 2014), A Level students were assigned to an A Level specialism. The numbers and percentages of university and non-university students with each specialism are shown in Table 21. Table 22 and Table 23 show the breakdowns by type of HE institution and overall ranking, respectively.
Table 21 shows that there were higher percentages of students specialising in Humanities, Languages or STEM subjects at A Level in the group of students that enrolled in HE than in the group of students that did not. The similar pattern can be seen for students with multiple specialisms but, for the remaining specialisms (applied, expressive, none), the pattern was the opposite.
Over half of the students in Oxbridge were specialist in STEM (Table 22). This contrasts with only $13.7 \%$ or $18.5 \%$ in low or medium ranked HE institutions, respectively (Table 23). The percentage of students with multiple specialism was also higher at Oxbridge than at other institutions and just over 30\% of the students in low ranked universities did not have an A Level specialism.

Table 23 also shows that the percentage of specialists in Humanities decreased with the increasing ranking of the HE institutions. On the contrary, the percentages of specialists in STEM and Language subjects increased with the increasing ranking of the HE institutions (e.g., for STEM, the percentage increased from $13.7 \%$ in low ranked institutions to $41.1 \%$ in high ranked ones).
It is worth noting that the above patterns might be influenced by the type of degrees (and entry requirements) offered at the different types of HE institutions.

Table 21: A Level specialism

Schools and colleges offer a wide range of A Levels; (Gill [2017], for example, gives a comprehensive report on the provision of A Level subjects in schools and colleges in England in 2016) and, in theory, many subject combinations are possible. In this research, there were 17,923 different combinations of at least three A Level subjects. The most common combinations were those involving Science subjects. These are almost certainly influenced by the entry requirements to Science-based degrees at university.
Table 24 shows the most popular 20 combinations of A Level subjects held by university students and by non-university students. The data has been restricted to students who have taken at least three A Levels. Notably, the combinations in the list were almost the same for the three groups of students, although the ordering varied.

As mentioned above, the list is dominated by combinations of Science subjects, with Biology, Chemistry and Mathematics being by far the most popular combination. The most common combination consisting of Humanities subjects only was English Literature, History and Psychology (in $7^{\text {th }}$ position). Although as Table 2 showed, Chemistry and History were taken by similar numbers of university students, Chemistry featured in seven of the top 20 combinations, whereas History was only in five. The reason is likely to be because of the variety of Humanities subjects commonly taken at A Level, compared to the relatively small number of Science subjects. Mathematics featured in 11 of the most popular 20 combinations.
Table 25 to Table 30 show the most popular A Level subject combinations among students attending different types of institutions (restricted to students who have taken at least three A Levels). The ranking and percentage across all university students (again restricted to students with at least three A Levels) is also shown for comparison.
While the top two A Level subject combinations overall were strongly represented in each of the university groups, there were some more unusual combinations, particularly in the low ranking universities (Law + Psychology + Sociology) and in the group including Oxford and Cambridge (Economics + Mathematics + Mathematics [Further] + Physics).
Combinations taken by students in each degree subject area are reported in Appendix C.

Table 24: Top-20 combinations of A Level subjects

| Combinations of A Level subjects | A Level <br> cohort |  | University <br> students |  | Non-University <br> students |  |

### 3.2 Performance in A Level subjects

This section of the report investigated the performance in the most popular A Level subjects, and in combinations of A Level subjects, of students who started a HE course in the academic year 2016/17. A comparison of the performance in the most popular A Level subjects, and in combinations of A Level subjects, between students enrolled in HE and the national A Level cohort is also reported here.
Alongside the percentages of students achieving specific grades in each subject (grade A*; at least grade A; at least grade C), other A Level performance indicators were used: the percentage of students achieving AAB grades; the percentage of students who achieved AAB including two facilitating subjects; the number of $A^{*} / A$ grades achieved in facilitating subjects; and the A Level points in best (up to) three A Levels.

Breakdowns by type of HE institution and degree subject area are also reported here. Breakdowns by students' characteristics (e.g., gender, prior attainment, type of school, level of deprivation) are reported in Appendix D.

Table 31 shows the percentages of students achieving particular grades (grade $\mathrm{A}^{*}$; at least grade A; at least grade C) in each A Level subject, as a percentage of those taking the A Level subject. Only A Level subjects with an overall uptake level of more than 1 per cent were included in the analyses. Subjects were ordered by overall uptake (highest first).
Table 31 shows, for example, that top grades were more frequent among university students than among non-university students. For example, among the university students with an $A$ Level in Mathematics, $21.8 \%$ had an A* and $48.8 \%$ had at least grade A. This compared with $13.3 \%$ and $33.4 \%$, respectively, amongst non-university students.
Table 32 (32-1 and 32-2) and Table 33 (33-1 and 33-2) show the percentages achieving grade $A^{*}$, at least grade A and at least grade C in each A Level subject, by type of HE institution and overall ranking of the HE institution, respectively. As above, only A Level subjects with an overall uptake level of more than $1 \%$ were included in these tables.
As an example, Table 32-1 shows that there were more students with grade $A^{*}$ and at least grade A in A Level mathematics in universities of the Russell Group ( $35.5 \%$ and $73.9 \%$, respectively) than at university overall ( $13.3 \%$ and $33.4 \%$ ). Table $32-2$ shows similar results for students in universities in the Sutton Trust Top-30. Percentages of students with A* (and at least grade A) in Mathematics were highest in Oxford and Cambridge universities (Table 32-1).

Table 31: Percentages of students achieving grade $A^{*}$, at least grade $A$ and at least grade $C$ in each A Level subject

| A Level subject | University students |  |  |  | Non-University students |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | A* | At least A | At least C | Number of students with the A Level | A* | At least A | At least C | Number of students with the A Level |

Table 34 shows the cumulative distribution of A Level grades held by university students, non-university students and the national A Level cohort. This analysis is restricted to students holding (that is, achieving at least an E in) more than three A Levels. For clarity and brevity, A* grades are represented as "*" in this table. The grades have been compared on an individual basis, so higher grades in one A Level do not compensate for lower grades in another; for example, ${ }^{* *} \mathrm{C}$ is not classed as ABB or above (i.e., ${ }^{* *} \mathrm{C}$ would appear as BBC or better). Only the best three grades held by each student have been used.
The highest grade combinations (for example *AA and above) were more frequent among university students than among non-university students, and also more frequent among university students than among the national A Level cohort.

Table 34: Cumulative distribution of A Level grades

| Grade <br> combination <br> (at least) | A Level <br> students <br> $(\mathbf{N}=\mathbf{1 9 8 , 3 8 5})$ | University <br> students <br> $(\mathbf{N}=\mathbf{1 2 6 , 5 4 0})$ | Non-University <br> students (71,845) |
| :--- | :---: | :---: | :---: |
| ${ }^{* * *}$ | 2.68 | 3.22 | 1.68 |
| ${ }^{* *}$ A | 6.43 | 7.55 | 4.39 |
| ${ }^{*}$ AA | 11.77 | 13.66 | 8.29 |
| AAA | 15.75 | 18.19 | 11.29 |
| AAB | 26.14 | 29.69 | 19.65 |

The tables and figures below show the percentage of candidates with A Level grades equal to or exceeding the AAB threshold, overall and broken down by type of HE institution and by degree subject area. Approximately a quarter of university students ( 23 per cent) achieved AAB or above (Table 35). However, there is wide variation in these measures across university groups, with over half of the Russell Group students holding AAB or above, but only 3 per cent of students in universities with an overall ranking of medium doing so (Table 36).

Table 35: Students achieving AAB or above (A Levels only), overall and by type of HE institution

| Students ... | N | \% |
| :--- | :---: | :---: |
| A Level | 50,235 | 18.16 |
| University | 36,895 | 23.09 |
| Non-University | 13,340 | 11.41 |
|  |  |  |
| Russell Group | 29,285 | 56.46 |
| Sutton Trust Top-30 | 32,200 | 53.22 |
| Oxbridge | 3,755 | 95.89 |

Table 36: Students achieving AAB or above (A Levels only), by ranking of HE institution

| HE Institution ranking |  | $\mathbf{N}$ | $\%$ |
| :--- | :--- | :---: | :---: |
| Overall | High | 34,465 | 44.44 |
|  | Medium | 1,685 | 3.38 |
|  | Low | 520 | 1.76 |

|  | Medium | 2,490 | 4.32 |
|  | Low | 580 | 1.95 |
| Graduation Prospects | High | 39,170 | 54.14 |
|  | Medium | 2,610 | 5.23 |
|  | Low | 875 | 2.52 |

Figure 1 shows that over $90 \%$ of the students enrolled in a Medicine and Dentistry degree and almost $80 \%$ of those in Veterinary Science achieved AAB or above. Just under 50\% of the students in Mathematical Sciences degrees also achieved AAB or above. The degree subject areas with lower percentages of students above the AAB threshold (under 10\%) were Business and Administrative Studies, Agriculture, Mass Communications and Documentation, and Education.

Figure 1: Students achieving AAB or above (A Levels only), by degree subject area

Table 37, Table 38 and Figure 2 show the percentage of candidates with A Level grades equal to or exceeding the AAB threshold, including two facilitating subjects.

Table 37: Students achieving AAB or above including two facilitating subjects (A Levels only), overall and by type of HE institution

| Students ... | $\mathbf{N}$ | \% |

|  | Medium | 1,465 | 2.93 |
|  | Low | 220 | 0.63 |

Figure 2: Students achieving AAB or above including two facilitating subjects (A Levels only), by degree subject area

Table 39, Table 40 and Figure 3 show the A Level points per entry ${ }^{21}$ (points in best - up to three A Levels), overall and broken down by type of HE institution and by degree subject area.
Students enrolled in HE scored, on average, 32 points per A Level entry (slightly higher than the A Level cohort). This measure was higher in Russell Group and Sutton Trust Top-30 universities and highest in Oxbridge ( 55 points per entry). Table 40 shows that the average points per entry was quite low in HE institutions with a low overall ranking (21 points per entry).

Table 39: A Level points per entry (points in best - up to - three A Levels), overall and by type of HE institution

| Students ... | Mean | Standard <br> Deviation | Number <br> of <br> students |

[^8]Figure 3 shows that students enrolled in either a Medicine and Dentistry degree or in a Veterinary Science degree had the highest average A Level points per entry (around 50 points per entry). They were closely followed by students doing degrees in Mathematical or Physical Sciences and degrees in Languages. Students with the lowest A Level points were enrolled in degrees in the areas of Mass Communications and Documentation, Computer Science, Creative Arts and Design, and Education.

Figure 3: A Level points per entry (points in best - up to - three A Levels), by degree subject area

### 3.3. Factors affecting enrolment in HE

As discussed in Section 2.2, the relationship between enrolment in HE and A Level subject uptake was investigated using regression analyses. In particular, multilevel logistic regression analyses were carried out in order to look at the relationship between enrolment in HE and A Level specialism, controlling for background variables including performance at A Level and students' characteristics derived from the data (e.g., gender, prior attainment, previous institution type, socio-economic background).
Two different sets of regression models were considered: whilst the first set of models looked at enrolment in HE amongst the national A Level cohort (the outcome variable being an indicator of enrolment at any HE institution), the second set of models focused on students who already enrolled in HE and investigated the likelihood of enrolling at a specific type of HE institution (the outcome variables being enrolment at an institution of the Russell Group, enrolment at a Sutton Trust Top-30 institution, enrolment at Oxford/Cambridge, and enrolment at a high ranked institution).
For each set of models, we pursued the following approach. In a first step, a model including only the main effects of the specialism at A Level was considered. The outcomes of this model (Model A) show the effects of each of the different A Level specialisms (STEM, Humanities, Languages, etc.) on the probability of enrolling in HE , controlling for student and school characteristics. To investigate whether some of the background characteristics (in particular, gender and school type) interact with A Level subject specialism to influence the
type of HE attended, a model including interaction terms between specialism and gender and between specialism and school type was also considered (Model B).

## Enrolment at any HE institution

Table 41 shows the effects of the A Level specialism on the probability of enrolling at any HE institution, after taking into account students' background characteristics such as their gender, prior attainment, prior institution, their A Level uptake (number of subjects) and their A Level performance ${ }^{22}$.

Model A in Table 41 shows that the A Level specialism was a significant predictor of attending HE, even after controlling for students' characteristics and taking into account school effects. In particular, students who specialised in expressive subjects were significantly less likely to enrol in HE than students with no specialism. On the contrary, students specialising in Humanities, Languages, STEM and those with a multiple specialism were significantly more likely to enrol at a HE institution than students with no specialism. Figure 4 shows that specialists in Humanities at A Level had the highest probabilities of attending HE, followed by STEM specialists. Students specialising in expressive A Levels were the least likely to enrol in HE.

[^9]Table 41: Enrolment in HE ~ regression analyses

Figure 4: Probability of enrolling in HE by A Level specialism ${ }^{23}$

Although not the main focus of this research, a brief summary of the effects of the background variables included in Model A on enrolment in HE, is provided below.

Gender. There was a significant gender effect on the probability of enrolling in HE. In particular, male students were significantly less likely to enrol in HE than female students with the same profile of attainment at both GCSE and A Level.
Type of school: Students with similar prior attainment and A Level uptake/performance from independent schools were less likely to enrol in HE in the year following completion of Key Stage $5^{24}$ than students from state schools.
Prior attainment: Prior attainment at school (measured by the average GCSE and equivalent point score per entry) was a significant predictor of enrolment at a HE institution. In particular, the probability of enrolment in HE increased with increasing prior attainment.

Number of A Levels: The probability of attending a HE institution increased significantly with the number of A Levels achieved. In particular, students having two A Levels were slightly more likely to be in HE than those with just one, after controlling for all other variables shown in Table 41. This likelihood increased further for students having three and four or more A Levels.
Number of A Levels in facilitating subjects: As above, the number of A Levels in facilitating subjects was a significant predictor of enrolment in HE. The likelihood of enrolling in HE increased for students having one, two or three A Levels in these subjects (compared to

[^10]students with none).The effect of having four or more was not significantly different to the effect of having just three.

A Level performance: Overall achievement at A Level was a significant predictor of enrolment in a HE institution. In particular, the higher the average A Level score, the higher the probability of enrolment, suggesting that A Levels are good preparation for university.
Note that the level of deprivation was missing for around 40,000 students (approximately 15 per cent of the A Level cohort). Furthermore, there was high collinearity between missing level of deprivation and type of school ( 75 per cent of the students with missing data were in independent schools). An alternative model with the level of deprivation categories included was fitted. However, the effect of the different school types and, more importantly in this research, the effect of the A Level specialism, were very similar to those in Model A. As a result, the level of deprivation was not considered in the remaining of this report. Results of the alternative model are given Table E1 in the Appendix E.

Model B, also shown in Table 41, investigated whether gender and type of school interact with A Level specialism to influence enrolment in HE.
Regarding gender, Model B shows that the interaction between gender and A Level specialism was significantly associated with enrolment in HE. Table 42 below shows how the probabilities of enrolling in HE by students with each of the A Level specialisms varied by gender. For example, male students specialising in STEM and expressive subjects were more likely than female students specialising in the same areas to enrol in HE. On the contrary, female students were more likely to enrol in HE than male students if they were specialists in applied, Humanities or Language A Level subjects. Female students were also more likely to enrol in HE if they had multiple specialisms or did not specialise at all.
Regarding type of school, Model B also shows that the interaction between type of school and A Level specialism was significantly associated with enrolment in HE. In particular, Table 43 shows how the probabilities of enrolling in HE by students with each of the A Level specialisms varied by type of school. Although students in independent schools had lower probability of enrolling in HE overall, the differences between these probabilities varied by A Level specialism: the smallest difference was between students specialising in expressive A Level subjects (followed by those with no specialism) and the highest difference was between students with multiple specialisms or specialist in STEM.

The effects of all other student characteristics on enrolment in HE were very similar to the effects reported for Model A.

Table 42: Enrolment in HE ~probability for students with each A Level specialism, by gender ${ }^{25}$

| Gender | A Level specialism |  |  |  |  |  |  |
| :--- | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | Applied | Expressive | Humanities | Languages | Multi | STEM | None |
| Female | 0.63 | 0.52 | 0.67 | 0.65 | 0.66 | 0.64 | 0.63 |
| Male | 0.59 | 0.58 | 0.63 | 0.64 | 0.64 | 0.66 | 0.60 |

[^11]Table 43: Enrolment in HE ~ probability for students with each A Level specialism, by type of school ${ }^{26}$

| Type of school | A Level specialism |  |  |  |  |  |  |
| :--- | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | Applied | Expressive | Humanities | Languages | Multi | STEM | None |
| Independent | 0.41 | 0.46 | 0.50 | 0.46 | 0.35 | 0.43 | 0.47 |
| State | 0.63 | 0.52 | 0.67 | 0.65 | 0.66 | 0.64 | 0.63 |

Models A and B in Table 41 were also fitted restricting the full A Level cohort to the group of students who achieved three or more A Levels (see Table E2 in Appendix E) ${ }^{27}$. The effect of A Level specialism, and the way in which students' characteristics (e.g., gender and type of school) interact with the specialism to influence enrolment in HE did not change much.

## Enrolment at different types of HE institutions

Regression models similar to the ones reported in Table 41 were fitted with the following outcome variables: enrolment at an institution of the Russell Group, enrolment at a Sutton Trust Top-30 institution, enrolment at Oxford/Cambridge, and enrolment at a high ranked institution ${ }^{28}$. The results are briefly described below and full details of the regression models are given in Appendix E.

A Level specialism was a significant predictor of attending a university of the Russell Group, even after controlling for students' characteristics and school effects such as the type of secondary school. Similarly to the results for enrolling in HE institutions in general (described in the previous section of the report), students specialised in expressive subjects were significantly less likely to enrol at a Russell Group institution than students with no specialism. On the contrary, students specialising in applied subjects, Humanities, Languages, STEM and those with a multiple specialism were more likely to enrol at a Russell Group institution than students with no specialism. The same patterns were found for the Sutton Trust Top-30 institutions and for high ranked institutions (see Tables E3, E4 and E6 in Appendix E).
Figure 5 shows that, after accounting for other student and school characteristics, specialists in Languages at A Level had the highest probabilities of attending institutions in the Russell and Sutton Trust Top-30 groups or institutions with a high overall ranking, followed by Humanities specialists. Students specialising in expressive A Levels were the least likely to enrol at HE in Russell and Sutton Trust Top-30 institutions and at high ranked institutions.

[^12]

Figure 5: Probability of enrolling in HE by type of institution and A Level specialism ${ }^{29}$

The A Level specialism effect was slightly different for students enrolling at Oxbridge. In particular students with no specialism were more likely to enrol in Oxbridge than students specialising in STEM or expressive subjects and more likely than students with multiple specialisms. Students specialising in Languages and Humanities were significantly more likely to enrol at Oxbridge than students with no specialism. Figure 6 shows that specialists in Languages at A Level had the highest probabilities of attending Oxbridge, followed by Humanities specialists and students with no specialism. Students specialising in expressive A Levels were the least likely to enrol at Oxbridge, followed by those with a specialism in STEM or applied subjects (see Table E5 in Appendix E for full details of the regression models relating to enrolment at Oxbridge).

[^13]

Figure 6: Probability of enrolling at Oxbridge by A Level specialism ${ }^{30}$

As in the previous section, and although not the main focus of this research, a brief summary of the effects of the background variables included in Model A (Tables E3 to E6 in Appendix E) on enrolment in HE , is provided below.

Gender. There was a significant gender effect on the probability of enrolling in specific types of HE institutions. Contrary to the effect on enrolment in HE, male students were significantly more likely than female students with the same prior attainment and same background characteristics to enrol at institutions in the Russell Group, at institutions in the Sutton Trust Top-30 group, at Oxford/Cambridge and at institutions with a high overall ranking.
Type of school: Students with similar prior attainment and A Level uptake/performance from independent schools were more likely to enrol at institutions in the Russell Group, at institutions at the Sutton Trust Top-30, and at institutions with a high overall ranking than students from state schools. There was not an effect of school type on the probability of attending Oxford or Cambridge. Note that the effect of school type on enrolling in specific institutions (generally prestigious and high ranked) was the opposite to the effect of school type on attending HE in general (students in independent schools were less likely to enrol in HE than students in state schools).

Prior attainment: Prior attainment at school (measured by the average GCSE and equivalent point score per entry) was a significant predictor of enrolment at any type of HE institution. In particular, the probability of enrolment at more prestigious institutions (e.g., Russell Group, Oxbridge, etc.) increased with increasing prior attainment.
Number of A Levels: The probability of attending a more prestigious group of universities (e.g., Russell Group, Oxbridge, etc.) increased significantly with the number of A Levels achieved. In particular, students having four A Levels were slightly more likely to be in the type of HE institutions looked at than those with just three (the baseline in these analyses) ${ }^{31}$, after controlling for all other student characteristics. This likelihood increased for students having five or more A Levels. There was one exception: having four A Levels did not have a

[^14]significant effect on the probability of attending a Russell Group institution, relative to having three.

Number of A Levels in facilitating subjects: As above, the number of A Levels in facilitating subjects was a significant predictor of enrolment in the type of HE institutions looked at in this section of the report. The likelihood of enrolling in HE increased with the increasing number of A Levels in these subjects. However, there was one exception: having just one A Level in a facilitating subject did not have a significant effect on the probability of attending Oxbridge relative to not having any.
A Level performance: Overall achievement at A Level was a significant predictor of enrolment in any type of HE institution. In particular, the higher the average A Level score, the higher the probability of enrolment at more prestigious institutions.
Parental Education: Students whose parents attended HE were more likely to enrol at institutions in the Russell Group, at institutions at the Sutton Trust Top-30, and at institutions with a high overall ranking than students whose parents did not. However, all else being equal, the effect of parental education on the probability of attending Oxford or Cambridge was negative (and still statistically significant).

In this section, we also investigated whether gender and type of school interact with A Level specialism to influence the type of HE institution attended. A summary of the results (in the form of probabilities of enrolment) is given in Table 44 and Table 45. Full results of these investigations are reported in Tables E3 to E6 in Appendix E (Model B in each of the tables).

It was found that the interaction between gender and A Level specialism was significantly associated with the type of HE institution attended. Table 44 below shows how the probabilities of enrolling in different types of HE institutions by students with each of the A Level specialisms varied by gender. For example, the probability of attending an institution in the Russell Group and the probability of attending Oxbridge for a specialist in STEM were very similar for males and females. However, all else being equal, male students specialising in STEM were more likely than female students specialising in the same area to enrol in one of the Sutton Trust Top-30 institutions and were also more likely to enrol in a high ranked institution. Furthermore, female students were more likely to enrol in Russell Group institutions than male students were if they specialised in Language subjects at A Level or if they had multiple specialisms. On the contrary, female students as above were less likely than male students to enrol in Oxbridge.

Regarding type of school, its interaction with A Level specialism was also significantly associated with the type of HE institution attended. In particular, Table 45 shows how the probabilities of enrolling in HE by students with each of the A Level specialisms varied by type of school. For example, all else being equal, STEM specialists were more likely to attend Russell Group or Sutton Trust Top-30 institutions if they took their A Levels in an independent school than if they did so in a state school. However, for these students, the probability of attending Oxbridge did not vary by the type of school attended.
For Russell Group institutions, the smallest difference in the probabilities of enrolment between students from independent and state schools was between specialists in expressive A Level subjects (followed by those with an specialism in applied subjects) and the highest difference was between students with no specialism or specialists in Humanities. Differences in the probabilities of enrolment in Oxbridge between both groups of students were not very big for any specialism.

Table 44: Enrolment at different types of HE institutions ~probability for students with each A
Level specialism, by gender ${ }^{32}$

| Type of <br> university | Gender | A Level specialism |  |  |  |  |  |  |  |

| 0.79 | 0.76 | 0.74 |  |  |  |  |  |

The relationship between the uptake of individual A Level subjects and enrolment in different types of institutions was also investigated via regression analyses. Regression models were fitted for the following outcome variables: enrolment at an institution of the Russell Group, enrolment at a Sutton Trust Top-30 institution, enrolment at Oxford/Cambridge, and enrolment at a high ranked institution. The independent variables included in the models were a series of indicators of uptake of individual A Level subjects (e.g., Mathematics, taking the value 1 if the student achieved an A Level in the subject, and 0 if the student did not). Students' characteristics (e.g., gender, type of school, prior attainment, parental education, and $A$ Level performance) were controlled for.
For each of the A Level subjects taken by at least 1 per cent of the A Level cohort, the figures below (Figure 7 to Figure 10) show their effect on the probability of enrolment at different types of institutions. However, instead of the coefficient estimates, odds ratios (which are easier to interpret) are presented.

[^15]The odds ratios represent the factor of increase in the odds of enrolling in HE when the student has achieved some specific A Level subject, compared to not have achieved it. The actual magnitude of the odds ratios is difficult to interpret (see Osborne [2006] for an extended discussion); however, the relative magnitude of the odds ratios can be very informative. An odds ratio greater than 1 indicates an increase in the likelihood of enrolling in HE, with a greater odds ratio indicating a greater likelihood. Conversely, an odds ratio less than 1 indicates a decrease in the likelihood of enrolling in HE, with a smaller odds ratio indicating a smaller likelihood. Finally, an odds ratio equal to 1 indicates an equal likelihood of enrolling in HE.
For example, for the subjects at the top of Figure 7 (e.g., Art \& Design; Media/Film/TV Studies; Business Studies; Psychology; Law) the odds ratios are below one and, therefore, those subjects had a negative effect on the probability of enrolling in a university of the Russell Group. However, STEM subjects, Languages, English Language, English Literature, History and Geography ("facilitating" subjects) increased the probability of enrolment (odds ratios bigger than one). Similar results were found for the probability of enrolling in a Sutton Trust Top-30 institution (Figure 8).

Figure 9 shows the effects of each individual subject on the probability of attending Oxford or Cambridge universities. After controlling for other factors, such as GCSE and A Level attainment, the A Level subjects with the highest (bigger than one), odds ratios were, again, the more academic A Levels. The effect of subjects such as Art \& Design, Media/Film/TV Studies or Sociology, although being positive, was not statistically significant. Having an A Level in Business Studies (odds ratio $=0.27$ ) decreased significantly the probability of attending Oxford or Cambridge universities.

Finally, Figure 10 shows the effects of each individual subject on the probability of attending high ranked institutions. Contrary to the findings discussed above for institutions in the Russell Group or in the Sutton Trust Top-30 group, having A Levels in Business Studies, Economics, Sociology or Psychology increased the probability of enrolment (odds ratios bigger than one). The effect of the "academic" A Levels (e.g., English Literature, English Language, STEM subjects, Languages) was also positive. There was only one subject that had a statistically significant and negative effect on the probability of enrolment: Physical Education. The effect of the subjects between Art \& Design, Textiles and Media/Film/TV Studies (see Figure 10) was not statistically significant.
The statistical significance of all the effects displayed in the figures below is shown in Table E7, in Appendix E.

Figure 10: Enrolment in high ranked institutions, by A Level subject ~odds ratios (having an A Level in subject vs. not having it)

## 4. Conclusions and discussion

The process of application and admission to universities in the UK places a relatively strong weight on the type of A Level subjects achieved by students. As a result, A Level choice is a key factor influencing progression from secondary education to HE. This research aimed to provide quantitative evidence to show how different $A$ Level subjects (and combinations of $A$ Level subjects) are used by students to access HE and, in particular, different types of HE institutions.
A great deal of the research carried out into progression to HE in England in recent years has focused on the ability of traditional (academic) vs. non-traditional (vocational) qualifications to support students' progression (e.g., Hayward \& Hoelscher, 2011; Chowdry et al., 2013; Vidal Rodeiro, Sutch, \& Zanini, 2015; McCoy \& Adamson, 2016; Hupkau et al., 2016). However, little work on the role of A Level subject choice in access to HE (and different types of HE) has been published to date. Vidal Rodeiro and Sutch (2013) investigated, using data from UCAS ${ }^{34}$, the proportions of students who held each A Level subject when applying for a place at university. The outcomes of that research provided information about the usefulness of specific A Level subjects or combinations of A Level subjects as currency for university study. In a more recent study, Sutch, Zanini, and Vidal Rodeiro (2016) examined how students' choice of A Level subjects and attainment influenced their HE destinations (specific types of HE institutions; specific fields of study). The statistical analyses carried out in their research revealed that there was a relationship between A Level subject specialism and the type of university attended. In particular, specialising in STEM or multiple subject areas greatly increased the likelihood of studying in a Russell Group university. This also held for Languages and Humanities, although in this case the magnitude of the association was smaller. Dilnot (2018) examined the relationship between league table score of university attended and A Level subject choices. She found that holding more "facilitating" A Levels was associated with attending a higher ranked university and suggested that more research was needed to further understand these relationships.

In the current research, HESA data gathered at individual level and covering all full-time, first year undergraduates, domiciled in England, studying at UK universities in the 2016/17 academic year was considered. This data was linked to NPD extracts to include records of the qualifications taken at school (both at Key Stage 4 and at Key Stage 5) and students' background characteristics. Having background data (e.g., type of school; prior attainment; level of deprivation; parental education) allowed the investigation of the uptake of A Level subjects/combinations by specific subgroups of undergraduate students such as those with higher/lower academic ability, those in independent/state schools or those living in incomedeprived areas.

Together with simple descriptive statistics which showed the popularity of A Level subjects and combinations of A Level subjects in relation to university participation, multilevel logistic regressions were employed to study the likelihood of students with different combinations of A Levels to study in specific HE institutions, once students' characteristics had been accounted for.
The key results of the analyses presented in this report are summarised and discussed below.

[^16]
## Uptake of A Level subjects

The most popular subjects amongst university students were Mathematics, Psychology, Biology, History, Chemistry and English Literature. However, these A Level subjects were represented in different proportions in HE and particularly in the different institution types. For example, students in Cambridge and Oxford universities held A Levels in STEM subjects and in Foreign Languages in higher proportions than students in other universities. There was also variation in the uptake of applied subjects (e.g., Design \& Technology, Art \& Design, Business Studies, ICT, Media Studies) and Humanities (e.g., Psychology, Sociology) between the different types of HE institutions. Overall, higher proportions of students not in Russell Group, Oxbridge and the Sutton Trust Top-30 group universities held A Levels in those subjects than students in such institutions. There was also variation on the popularity of the A Level subjects by the different university rankings. For example, STEM subjects were more popular amongst students in institutions of high research quality and high graduation prospects than in institutions with lower rankings in these areas. However, Biology and Chemistry were more popular amongst students in institutions of low student satisfaction than in institutions rated high by their students. The opposite patterns were found in subjects such as physical education or law.
The uptake figures summarised above show that subject choice has a significant effect on the type of HE institution attended. This supports the view, argued previously (e.g., Purcell et al., 2008; Fazackerly \& Chant, 2008; Russell Group, 2017; Dilnot, 2018), that careful choice of subjects post-16 is crucial to avoid students inadvertently closing their options down prematurely.
The number of A Level subjects held by students also varied across the different types of HE institutions considered in this research. Students at Oxford and Cambridge held the highest number of A Level subjects and students attending low ranking institutions the lowest. Similar patterns were found for A Levels in facilitating subjects. In particular, the number of A Levels in facilitating subjects increased with the increasing overall ranking of the HE institution and the number of less suitable A Levels decreased. Similar results were found in Dilnot (2018), which showed that each facilitating subject was associated with being at a university with a Times Good University Guide score 14 points higher, even when A Level performance, prior attainment at GCSE and school type were accounted for.
Previous research (e.g., Sutch, Zanini, \& Vidal Rodeiro, 2016) showed that students with more academic backgrounds were more likely to go to universities in the Russell Group and those holding vocational qualifications were more likely to study in other types of universities. The current study supports this. In fact, over half of the students in Oxbridge were specialist in STEM (achieved two or more A Levels in this subject area) and the percentages of specialist in STEM and Language subjects increased with the increasing ranking of the HE institutions. It should be noted that one reason for this could be that STEM degrees courses are more common in high ranking and prestigious HE institutions and the more applied/vocational degrees are over-represented in other types of HE institutions.
Candidates with A Levels in less academic or applied subjects could be, for example, more attracted to the latter types of degrees and therefore their university choices are determined by their degree choices.

## Performance in A Level subjects

As expected, the outcomes of the analyses looking at performance in individual A Level subjects showed that top A Level grades ( $A^{*}$; at least grade $A$ ) were more common among university students than among non-university students and that there was huge variation by type of HE institution attended. Similarly, when looking at the students who achieved the AAB threshold, the analyses showed that over half of the Russell Group students and almost all students in Oxbridge ( 96 per cent) were holding AAB or above. However, only 3 per cent
of students in universities with an overall ranking of medium reached the threshold. This gulf between the grade distributions of students attending universities in the Russell Group and students attending other institutions had already been reported by Vidal Rodeiro and Sutch (2013).

Variation in admissions offers across degree subject areas is likely to account for much of the relationship between degree subject at university and performance at A Level. The current research showed, for example, that over 90 per cent of the students enrolled in a Medicine and Dentistry degree and almost 80 per cent of those in Veterinary Science achieved $A A B$ or above. Both these degree subject areas are particularly competitive so it is not surprising that the A Level attainment of the students pursuing them was very high. Students doing degrees in Mathematical or Physical Sciences and degrees in Languages also had high A Level attainment. Students with the lowest A Level attainment were enrolled, generally, in degrees in the areas of Mass Communications and Documentation, Computer Science, Creative Arts and Design, and Education.

## Factors affecting enrolment in HE

The regression analyses carried out in this research revealed that there was a relationship between A Level subject specialism and the type of university attended and that this association holds even after controlling for other variables, such as attainment and type of school attended.

In particular, students specialising in expressive subjects were significantly less likely to enrol in HE, and to attend an institution in the Russell Group, than students with no specialism were. On the contrary, students with Humanities, Languages or STEM specialisms and those with a multiple specialism were significantly more likely to enrol at a HE institution than students with no specialism. The same patterns were found for the Sutton Trust Top-30 institutions and for high ranked institutions. The A Level specialism effect was slightly different for students enrolling at Oxbridge. For example, students with no specialism were more likely to enrol in Oxbridge than students specialising in STEM or expressive subjects and students specialising in Languages and Humanities were significantly more likely to enrol at Oxbridge than students with no specialism.
Across all the models fitted in this work, a common result emerged: the probability of attending any HE institution increased significantly with the number of A Levels achieved and with the number of A Levels in facilitating subjects. This was, again, consistent with previous research (Vidal Rodeiro \& Sutch, 2013; Dilnot, 2018) and suggests that, studying A Levels in facilitating subjects may be a sensible choice for students wanting to attend prestigious and high ranked HE institutions.

Although not the main focus of this work, the regression analyses showed that there was a significant gender effect on the probability of enrolling in HE. Male students were significantly less likely than female students with the same prior attainment and same background characteristics to enrol in HE. However, if they enrol at all, male students were significantly more likely than female students to attend institutions in the Russell Group, institutions at the Sutton Trust Top-30, Oxford/Cambridge and institutions with a high overall ranking.
As expected, and in line with previous research (e.g., HEFCE, 2003; Smith \& Naylor, 2005; Crawford, 2014; Vidal Rodeiro \& Zanini, 2015), A Level performance was strongly associated to participation in HE and to attendance to specific types of HE institutions. Specifically, the higher the average A Level score, the higher the probability of enrolment in HE overall and, for those who enrol, the probability of attending more prestigious institutions. Similarly, performance at Key Stage 4 was found to be an important factor for university entry, even after taking into account the performance at A Level.

Although, all else being equal, students in independent schools were less likely to enrol HE immediately after completing their A Levels, the probability of attending prestigious or high ranked institutions was higher for them compared to similar students in state-maintained schools. This is important from a widening participation point of view, as it supports other research findings (e.g., Sutton Trust, 2011; Chowdry et al., 2013; Sullivan et al., 2014) in providing evidence that young people from state, rather than independent, schools continue to be under-represented at high-status universities. However, in contrast, there was not an effect of school type (independent vs. state) on the probability of attending Oxford or Cambridge.

In an attempt to investigate whether or not gender and school type interacted with the A Level specialism to influence the type of HE institution attended, further regression models including an interaction term between A Level specialism and these student characteristics were fitted.

The results of this set of models showed that, when prior schooling and other background characteristics were accounted for, the likelihood of enrolling in HE by students with each of the A Level specialisms varied, indeed, by gender and type of school.
Male students specialising in STEM and expressive subjects were more likely than female students specialising in the same areas to enrol in HE. On the contrary, female students were more likely to enrol in HE than male students if they were specialist in applied, Humanities or Language A Level subjects. Female students were also more likely to enrol in HE if they had multiple specialisms or did not specialise at all. Although these patterns were fairly similar for the likelihood of enrolling in different types of HE institutions, there were a few differences: the probability of attending an institution in the Russell Group or being at Oxbridge for a specialist in STEM was almost identical for males and females; and female students were less likely to enrol in Oxbridge than male students were if they specialised in Language subjects at A Level or if they had multiple specialisms.
Regarding type of school, its interaction with A Level specialism was also significantly associated with the type of HE institution attended. For example, STEM specialists were more likely to attend Russell Group or Sutton Trust Top-30 institutions if they took their A Levels in an independent school than if they did so in a state school. However, for these students, the probability of attending Oxbridge did not vary by the type of school they attended.

This research has showed a clear relationship between A Level specialism and the type of HE institution attended and that this relationship varied by gender and school type. However, the multilevel logistic regression, as any regression technique, can only ascertain relationships, but never be sure about the underlying causal mechanism. Therefore, caution must be taken when interpreting the results of the regression analyses presented in this work. There might be other factors that cannot be measured and that might have a direct impact on university participation that this work did not take into account (though the most relevant identified by the literature in this field were accounted for).

The above results confirm that, although careful choice of A Level subjects/specialisms is crucial for enrolling in HE and, in particular, for enrolling in specific HE institutions, background characteristics such as gender and school type are still part of the explanation for differential participation in HE in the UK. While the access gap between students from different backgrounds has narrowed somewhat in recent years due to widening participation activities, the gap in the most selective institutions remains (Boliver et al., 2017).
Contextualising admissions (i.e., taking into account a candidate's background when making decisions) might be one way to make progress towards narrowing the gap. Some HE institutions had already changed their admissions requirements for state school students and for students from disadvantaged backgrounds (Ogg, Zimdars, \& Heath, 2009; Boliver et al.,
2017) and continue with this practice. However, there is still scope to improve the use of contextual data in the admission processes to widen access and to reduce the differences in participation between students with different backgrounds, particularly at elite and highly selective institutions such as those in the Russell Group or the Sutton Trust Top-30.

## Appendix A: Uptake of A Level subjects ~ breakdowns by students' background characteristics

Tables A1 to A6 below show the background characteristics (gender, prior attainment at GCSE, level of deprivation and type of school) of the A Level students in this study, overall and by the type of HE institution attended.

Table A1: A Level cohort and students enrolling in HE, by background characteristics

| Background characteristics |  | All students ( $\mathrm{N}=276,705$ ) |  | $\begin{gathered} \hline \text { University } \\ \text { students } \\ (\mathrm{N}=159,790) \\ \hline \end{gathered}$ |  | $\begin{aligned} & \hline \text { Non-University } \\ & \text { students } \\ & (\mathrm{N}=116,910) \\ & \hline \end{aligned}$ |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  |  | N | \% | N | \% | N | \% |
| Gender | Female | 154,285 | 55.76 | 91,210 | 57.08 | 63,080 | 53.95 |

Uptake of A Level subjects and combinations of A Level subjects by different background characteristics are reported in Statistics Reports published in the Cambridge Assessment website (and therefore not included in this report). For example, Carroll and Gill (2017) investigated the uptake of A Level subjects in 2016. Their analyses included:

- number of A Levels by school type, prior attainment and deprivation group;
- uptake of individual A Levels by gender, school type, prior attainment and deprivation group;
- uptake of the most common combinations of A Level subjects by gender;
- uptake of subject areas by gender and prior attainment; and
- number of "facilitating" subjects taken, by gender, prior attainment, school type and deprivation.

Tables A7 to A12 (1-3) below report the students' A Level specialism by background characteristics, and broken down by type of HE institution.

Table A7: A Level specialism, by background characteristics ~university students

| Background characteristics |  | A Level specialism |  |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  |  | Applied | Expressive | Humanities | Languages | Multi | None | STEM |

## Appendix B: Classification of A Level subjects

## Dilnot's taxonomy

A Level subjects were categorised using the following taxonomy proposed by Dilnot (2018):

| Facilitating | $\underline{\text { Useful }}$ |  |
| :--- | :--- | :--- |
| Arabic | Ancient History |  |
| Bengali | Archaeology |  |
| Biblical Hebrew | Classical Civilisation |  |
| Biology | Classics |  |
| Chemistry | Computing |  |
| Chinese | Welsh first Language |  |
| Classical Greek | Economics |  |
| Welsh second Language | Economics and Business |  |
| Dutch | English Language and Literature |  |
| English Literature | English Language |  |
| French | Environmental Science |  |
| Further Mathematics | Geology |  |
| Geography | Government and Politics |  |
| German | History of Art | Non-counting |
| Greek (Modern) | Music | Critical Thinking |
| More limited suitability |  |  |
| Art and Design | Less effective preparation | Studies |
| Business Studies | Accounting |  |
| DT35: Product Design (3-D Design) | Anthropology |  |
| DT: Product Design (Textiles) | Applied Art and Design (double award) |  |
| DT: Systems and Control Technology | Applied Art and Design |  |
| Drama and Theatre Studies | Applied Business (double award) |  |
| Electronics | Applied ICT (double award) |  |
| Film Studies | Applied ICT |  |
| ICT | Applied Science (double award) |  |
| Law | Applied Science |  |
| Media Studies | Citizenship Studies |  |
| Music Technology | Communication and Culture |  |
| Physical Education | Creative Writing |  |
| World Development | Dance |  |
|  | DT: Foood Technology |  |

[^17]
## Bramley's taxonomy

A Level subjects were categorised, based on content, using the following taxonomy proposed by Bramley (2014):

Applied
Accounting and Finance
Applied Art \& Design
Applied Business
Applied Engineering
Applied ICT
Applied Science
Business Studies
Business Studies and Economics
Food Studies
Health and Social Care
Home Economics
Law
Leisure and Recreation
Physical Education
Travel and Tourism
World Development

## Humanities

Archaeology
Classical Studies
Critical Thinking
Drama and Theatre Studies
Economics
English Language
English Language \& Literature
English Literature
Environmental Studies
General Studies
Geography
Government \& Politics
History
History of Art
Media/Film/TV Studies
Other Communication Studies
Other Social Studies
Philosophy
Psychology
Religious Studies
Sociology

## Expressive

Art \& Design
Design \& Technology
Music
Performance Studies

Languages
STEM
French Biology
German
Other Modern Languages
Spanish
Chemistry
Computer Studies
Further Mathematics
Geology
Human Biology
ICT
Mathematics
Physics
Science

Note that there were some subjects that could not be unambiguously allocated to a category. For example, Geology (classified as STEM), Psychology (classified as a Humanity) and Applied Science (classified as Applied) could have been assigned to a different category. The Expressive categorisation was problematic in that Design \& Technology could perhaps also fit in the STEM or Applied categories, and that in some cases it is perhaps doubtful whether knowledge, skills and understanding are expressed mainly through performances and artefacts (as opposed to through written responses). See Bramley (2014) for more details on how these categorisations were devised.

## Appendix C: Combinations of A Level subjects taken by students in each degree subject area

Table C1: Top-10 combinations of A Level subjects, students enrolled in Agriculture and related subjects

| Combination of A Level subjects | $\%$ | Overall <br> $\%$ | Overall <br> Rank |
| :--- | :---: | :---: | :---: |
| Biology + Chemistry + Mathematics | 12.01 | 5.62 | 1 |
| Biology + Chemistry + Geography | 5.68 | 0.85 | 6 |
| Biology + Chemistry + Psychology | 5.19 | 1.65 | 4 |
| Biology + Geography + Psychology | 3.25 | 0.46 | 19 |
| Biology + Chemistry + History | 2.11 | 0.54 | 14 |
| Biology + Chemistry + Physics | 1.62 | 0.53 | 15 |
| Biology + Geography + Mathematics | 1.62 | 0.35 | 35 |
| Biology + Business Studies: Single + Geography | 1.30 | 0.07 | 208 |
| Art \& Design (Photography) + Biology + Psychology | 1.14 | 0.04 | 374 |
| Biology + Psychology + Sociology | 1.14 | 0.38 | 28 |

Table C2: Top-10 combinations of A Level subjects, students enrolled in Architecture, Building and Planning

| Combination of A Level subjects | $\%$ | Overall <br> $\%$ | Overall <br> Rank |
| :--- | :---: | :---: | :---: |
| Art \& Design (Fine Art) + Mathematics + Physics | 3.21 | 0.10 | 141 |
| Art \& Design + Mathematics + Physics | 1.88 | 0.07 | 209 |

[^0]:    ${ }^{1}$ The Russell Group represents 24 leading UK universities (https://www.russellgroup.ac.uk/).
    ${ }^{2}$ MillionPlus is the Association for Modern Universities in the UK (http://www.millionplus.ac.uk/).

[^1]:    ${ }^{3}$ Note that the data available for this work (see Section 2.1 for details) includes all students at the end of Key Stage 5 , who could have potentially applied to study a course in a HE institution. However, the data does not identify the students who made an application and only information about those who enrolled in HE is available.

[^2]:    ${ }^{4}$ Higher National Diploma/Higher National Certificate.
    ${ }^{5}$ Numbers have been rounded to nearest multiple of 5, following HESA's Standard Disclosure Control policy.
    ${ }^{6}$ Note that, for example, in 2017, the HE acceptance rate for A Level students was $88.9 \%$ and for students taking a combination of A Levels and BTECs it was $87 \%$ (UCAS, 2017a). Furthermore, 21,820 students aged 17 or 18 deferred (i.e., applied for a course and then take a year out before going to university) their university entry (UCAS, 2017b). This corresponds to $7.9 \%$ of the acceptances in that age group.

[^3]:    ${ }^{7}$ GCSE grades were converted into points as follows: $A^{*}=58 ; A=52 ; B=46 ; C=40 ; D=34 ; E=28 ; F=22 ; G=16$.
    ${ }^{8}$ Facilitating subjects are the subjects most commonly required or preferred by universities to get on to a range of degree courses, see, for example, Russell Group (2017).
    ${ }^{9}$ A Level grades were converted into points as follows: $A^{*}=60 ; A=50 ; B=40 ; C=30 ; D=20 ; E=10$.
    ${ }^{10}$ The definition of low income includes people who are out of work, but also those in work with low earnings. For further information on IDACI calculation, including definitions of children, families, and income deprivation, see https://www.gov.uk/government/publications/english-indices-of-deprivation-2015-technical-report.
    ${ }^{11}$ Science, Technology, Engineering and Mathematics.

[^4]:    ${ }^{12}$ A full list of universities can be obtained from the HESA website (https://www.hesa.ac.uk/) and the members of the Russell Group can be identified in the group's website (https://www.russellgroup.ac.uk/).

    ${ }^{15}$ Note that, although the groupings are of roughly equal size, higher ranked universities tend to have a greater number of students enrolled. Therefore, almost half of students are defined to be at institutions that have a high ranking overall.

[^5]:    ${ }^{16}$ Depending on the regression model (see Table 1), the socio-economic background was measured by the income related deprivation or by the parental education.

[^6]:    ${ }^{17}$ Throughout this report, all numbers have been rounded to nearest multiple of 5 , following HESA's Standard Disclosure Control policy.
    ${ }^{18}$ Note that the term "non-university students" refers to the 116,910 A Level students who were not in the HESA data. These students might not have applied to study in a HE institution, they might not have been offered a place at a HE institution, or they might have taken a gap year.

[^7]:    ${ }^{19}$ Note the "Languages" degree area includes courses, among others, in Linguistics, Literature, English, American Studies, Celtic Languages, Literature \& Culture, Latin, Ancient Greek, Classics or Languages Studies. Therefore, it is possible that a student enrolled in a Language degree without an A Level in French or Spanish.

[^8]:    ${ }^{21}$ A Level grades were converted into points as follows: $A^{*}=60 ; A=50 ; B=40 ; C=30 ; D=20 ; E=10$.

[^9]:    ${ }^{22}$ The measure of A Level performance considered in these analyses was the A Level points per entry. An alternative measure (AAB indicator) was included in the regression models instead of the A Level points, but the results (in particular, the effect of A Level specialism) were almost identical and therefore not reported here.

[^10]:    23 The calculated probabilities shown are for female students, attending a state school, taking three A Levels (one in a facilitating subject), and having average prior attainment and average A Level performance.
    24 Previous research (Crawford \& Cribb, 2012) showed that gap-year takers were more likely to come from families of higher socio-economic status, including having university-educated parents and higher household incomes. Also, they were more likely to come from schools with relatively few pupils on free school meals and higher average academic performance, or from independent schools. For example, using data from the wave 6 of the LSYPE (Longitudinal Survey of Young People in England), Crawford and Cribb (2012) show that nearly 20 per cent of gap-year takers come from independent schools.

[^11]:    ${ }^{25}$ These probabilities are for students in state schools, who achieved three A Levels (one in a facilitating subject) and with average attainment at Key Stage 4 and at A Level. Note that, although the probabilities are slightly different, the patterns (in terms of differences between male and female students) were the same for students in independent schools.

[^12]:    ${ }^{26}$ These probabilities are for female students, who achieved three A Levels (one in a facilitating subject) and with average attainment at Key Stage 4 and at A Level. Note that, although the probabilities are slightly different, the patterns (in terms of the differences between students in independent and state schools) were the same for male students.
    ${ }^{27}$ Note that, although A Levels continue to be the most popular qualification held by students who apply to HE, a whole range of other equivalent qualifications are also accepted by HE institutions.
    ${ }^{28} \mathrm{~A}$ high ranked institution in the regression analyses was an institution in the top-half of the universities listed in the Complete University Guide.

[^13]:    ${ }^{29}$ The calculated probabilities shown are for female students, attending a state school, taking three A Levels (two in facilitating subjects), and having average prior attainment and average A Level performance.

[^14]:    ${ }^{30}$ The calculated probabilities shown are for female students, attending a state school, taking three A Levels (two in facilitating subjects), and having prior attainment at the 90 per cent percentile and $A$ Level performance at the 90 per cent percentile.
    ${ }^{31}$ Note that the analyses reported in this section were restricted to students with three or more A Levels.

[^15]:    ${ }^{32}$ These probabilities are for students in state schools, who achieved three A Levels (two in facilitating subjects) and with average attainment at Key Stage 4 and at A Level. Note that, although the probabilities are slightly different, the patterns (in terms of differences between male and female students) were the same for students in independent schools.
    ${ }^{33}$ These probabilities are for female students, who achieved three A Levels (two in facilitating subjects) and with average attainment at Key Stage 4 and at A Level. Note that, although the probabilities are slightly different, the patterns (in terms of the differences between students in independent and state schools) were the same for male students.
