## Executive Summary

## Introduction

In February 2013, the Secretary of State for Education announced his intention to reform GCSEs "to ensure they are rigorous and robust, and give students access to high quality qualifications which match expectations in the highest performing jurisdictions". For mathematics, in particular, the new GCSE would "focus on ensuring that every student masters the fundamental mathematics that is required for further education and future careers", and, in particular, that it would "be more demanding" and "provide greater challenge for the most able students".

The new GCSE in mathematics had, therefore, a revised content and aimed to better prepare students for progression to future education and employment. It was first assessed in summer 2017. Key changes to the qualification were a greater emphasis on problemsolving and more demanding content, together with a new grading scale.

This research explored how well the GCSE in mathematics prepares young people for further study in mathematics and subjects with significant mathematical content in the context of GCSE reform. In particular, it looked at students' progression to level 3 mathematics and to different level 3 maths-related subjects, and at their performance in them pre- and post-reform.

The outcomes of this research will increase understanding of how recent reforms to the GCSE maths have affected students and will contribute evidence towards further understanding of progression from level 2 to level 3 mathematics.

## Data and Methods

This work addressed the research question via quantitative analysis of national results data available in the National Pupil Database (NPD). Candidates who completed a GCSE maths in each of the years from 2014 to 2017 (June sessions only) were followed up for two years and the level 3 qualifications they achieved were included in the research.

Progression from GCSE maths to the following level 3 qualifications was then investigated: A level maths; Level 3 maths qualifications (AS level maths, A level maths, AS level further maths, A level further maths, core maths); and maths-related A level subjects (biology, chemistry, physics, economics, psychology).
Descriptive statistics on the number and proportion of GCSE maths students progressing to the qualifications listed above (overall and by GCSE grade), pre-reform (2014-2016) and post-reform (2017) were produced. Marginal grade distributions for all level 3 qualifications, overall and for each GCSE maths grade, pre-and post-reform were also produced.

To further explore the effect of GCSE reform on progression to and performance in level 3 maths or maths-related subjects, controlling for students' backgrounds, multilevel logistic regression analyses were carried out.

## Findings

## Progression to A level maths

Contrary to fears of reduction in the uptake of A level maths following the reform this research showed that progression generally increased post-reform. However, when breaking it down by the grade achieved in GCSE maths, the increase in progression was higher amongst those who achieved at least grade A/7 than for students with at least grade C/4.
Performance in A level maths was, in general, lower post-reform. In particular, the probability of achieving at least grade A or at least grade C in A level maths was lower post-reform for students with any GCSE grade in maths, apart from the students at the very top of the GCSE grade distribution. However, it should be taken into account that students taking the reformed GCSE would have also taken the newly reformed A level in maths, and it is well known that student performance tends to dip slightly in the first years of a new qualification. Furthermore, research showed that the reformed A level specifications were significantly more demanding than legacy specifications, and there were concerns that while more able students may benefit from the more "aspirational" A level, lower performing students may be impacted negatively by the changes.

## Progression to level 3 maths

Progression to any level 3 maths qualification decreased post-reform. This decrease was present across the full GCSE grade range. A likely explanation of this result is the decrease in the uptake of AS in maths in further maths in 2019, possible due to A level reform and the decoupling of AS and A levels.

Progression to individual level 3 maths qualifications such as core maths or A level further maths generally increased post-reform, independently of the grade achieved by the students in their GCSEs. The increase was slightly lower amongst students who achieved at least grade A/7 than amongst students who achieved at least grade C/4 in core maths, whilst the opposite pattern was found for $A$ level maths.
Regarding performance in core maths and A level further maths, compared to the pre-reform years, students who achieved a GCSE maths post-reform were more likely to achieve top grades (grades A or B) in core maths. On the contrary, compared to the pre-reform years, students who achieved a GCSE maths post-reform were less likely to achieve both grade A or above and grade C or above in A level further maths.

## Progression to maths-related A level subjects

This research investigated the impact of GCSE maths reform on five maths-related A levels (biology, chemistry, physics, economics, and psychology) and found that overall progression was higher post-reform in all subjects.
Compared to the pre-reform years, performance in maths-related subjects was generally worse post-reform. In particular, the A level science subjects (biology, chemistry, and physics) performance was very similar pre- and post-reform for students with the very top GCSE grades in maths, but it was lower post-reform for students with lower grades in GCSE maths. However, in economics and psychology, performance was very similar pre- and postreform.

This research is set in the context of recent reforms to GCSEs and A levels and, as with any reforms, changes take time to bed in. Given that this research focussed on the first year after the reform (the new GCSE maths was first assessed in 2017), it is possible that the results do not reflect how the reformed GCSE maths will impact progression to and performance in level 3 maths and maths-related subjects over the coming years.

## Introduction

In February 2013, the Secretary of State for Education announced his intention to reform GCSEs "to ensure they are rigorous and robust, and give students access to high quality qualifications which match expectations in the highest performing jurisdictions" (Gove, 2013). The reform focused on changes to English language, English literature, and mathematics in the first instance.

For mathematics, in particular, the new GCSE would "focus on ensuring that every student masters the fundamental mathematics that is required for further education and future careers", and, in particular, that it would "be more demanding" and "provide greater challenge for the most able students" (Gove, 2013).

The new GCSE in mathematics had, therefore, a revised content and aimed to better prepare students for progression to future education and employment. It was first assessed in summer 2017. Key changes to the qualification were a greater emphasis on problemsolving and more demanding content, together with a new grading scale from 9 to 1 (with 9 being the highest grade). More details about the subject content and the main assessment features of the new GCSE can be found in DfE (2013) or Ofqual (2017).

This research explores how well the GCSE in mathematics prepares young people for further study in mathematics and subjects with significant mathematical content in the context of GCSE reform. In particular, it looks at students' progression to level 3 mathematics and to different level 3 maths-related subjects, and at their performance in them pre- and post-reform. The outcomes of this research will increase understanding of how recent reforms to the qualification have affected students, teachers and schools, and contribute evidence towards further understanding of progression from level 2 to level 3 mathematics.

## Background research

Prior to the GCSE reform, there were longstanding concerns about how well the GCSE in maths prepared students for progression to AS and A level study in mathematics.
Hernandez-Martinez et al. (2011) reported, drawing on interviews with students before and after the transition from school to college, that the GCSE in maths was inadequate preparation for many students with pass grades (especially grade C, but increasingly also grade B) for AS level study, with algebra being mentioned as the key problem. Similarly, Noyes and Adkins (2016) showed, using data from the National Pupil Database, that the numbers (and proportions) of GCSE maths grade C students completing any advanced mathematics were relatively small. In fact, around $99 \%$ of students achieving a grade $C$ in 2010 did not complete any advanced mathematics over the following 3 years. For GCSE grade B students, the story was only marginally better.
Rushton and Wilson (2014) carried out a survey of teachers to identify the areas of mathematics that were problematic for students who had just completed the GCSE and wanted to study the subject further at A level. They showed that teachers believed that students were prepared adequately for AS and A level courses in most areas of mathematics, but they also identified other areas (e.g., algebra) where GCSEs were considered not to prepare students well.

In a more recent study exploring the perceptions and experiences of the transition between GCSE and AS level mathematics of a small group of students, Rigby (2017) reported that the majority of students believed that the GCSE syllabus prepared them for the AS level syllabus but not to the extent they would have hoped. It was believed that a gap existed between the mathematics that are necessary to pass a GCSE and the mathematics that students need to be able to start AS or A level (e.g., Wiliam et al., 1999; Noyes \& Sealey, 2011). As a result, most schools were requiring high grades for entry onto $A$ level maths courses to make sure students were prepared for the transition: for example, students often had to have achieved a grade B at GCSE or even a grade $A$ in order to be accepted for an AS or A level in maths (e.g., Noyes \& Sealey, 2012). In Rigby's research (Rigby, 2017), one of the suggestions to improve the transition between GCSE and AS level was to change the GCSE syllabus to a more rigorous one, by including more AS level material (this has now been implemented within the reformed GCSEs). Although this should give students the necessary understanding of content and skills that are required at AS level, students of middle and low ability could struggle with the new qualification.

The tension between revising the GCSE qualification to be better preparation for the AS and A levels and ensuring that they were appropriate for students with lower grades who were not intending to continue to further study was problematic as, for example, including more rigorous content could have undesired effects on the transitions of some students.

Despite A level maths having a period of sustained growth in entries in the years prior to the GCSE reform (see, for example, Gill and Williamson (2016) and Gill (2018)), concerns about participation in post-16 maths have emerged in recent years. In particular, there have been concerns that the combination of the decoupling of AS and A levels, curriculum changes to the A level in maths, and changes to Key Stage 5 funding would lead to a reduction in the uptake of maths at level 3 (e.g., ALCAB, 2014; Lee et al., 2018; Redmond et al., 2020). Changes to the GCSE maths aimed to encourage students to better manage the transition to A level maths. However, the number of entries in A level maths fell by around $3.5 \%$ in $2019^{1}$ (DfE, 2019; 2020a), with suggestions from school leaders that students might have been losing confidence in their abilities in the subject or being less inclined to take it as it was perceived as quite hard.

To date, there is not much published research on how the reform of GCSE maths has affected maths learning and, in particular, on how it affected progression to further education (e.g., entries to A levels) or performance in level 3 maths (e.g., AS and A level maths; AS and $A$ level further maths) and maths-related subjects (e.g., Biology, Chemistry, Physics, Economics or Psychology).

One of the few studies that considered this issue in some detail was carried out by Ofqual (Howard \& Khan, 2019). They conducted interviews with A level maths teachers with experience in teaching students who had studied the legacy GCSE in maths and students who had studied the reformed GCSE. The interviews explored their perceptions of how the legacy and reformed GCSEs prepared students for A level study. In general, teachers were positive about the extent to which the reformed GCSE prepared students for A level and the majority commented that the reformed GCSE prepared students at least as well, if not better, than the legacy GCSE. The participants also reported that the reformed GCSE had positive implications beyond studying A level maths and that it would support students studying other subjects with mathematical content.

[^0]Humphries et al. (2017) also carried out a small qualitative study involving a sample of teachers (in 12 schools) who were engaged in delivering the new GCSE. Participating teachers expressed the view that "students sitting the reformed mathematics GCSE would be leaving Key Stage 4 with more mathematical knowledge than previous cohorts", and that this would apply across all attainment levels: "...there is additional content in both higher and foundation which would improve the standard, because obviously they've got to have more knowledge just at a very base level". This was an important point as it is well documented that participation in A level maths has been skewed toward those with high GCSE grades in the subject.

Grima and Golding (2019) and Pearson Education (2019), who carried out a programme of research looking at the introduction of the new GCSE maths, reported similar findings to those outlined above. However, although the general consensus was that the new GCSE prepared students well for A level, there were concerns about how the weaker students (those with a grade 5 or 6) would feel about their abilities in maths. This was also mentioned by the participants in a study by Lee et al. (2018) who reported on a large-scale survey of post-16 mathematics teachers carried out by $\mathrm{MEI}^{2}$. The participants in this study additionally suggested that they had seen a reduction in mathematical confidence for students at a grade A/7 level, observing that "with only $52 \%$ of the marks ${ }^{3}$ required for a grade 7 it may be the case that students who would feel confident and capable of studying maths with a grade A in the past may no longer feel as confident and therefore as motivated to study the subject".

## Aim of the research

The current research aims to add to the qualitative analysis of existing research described above by approaching the question on how the reform of GCSE maths has affected progression to further education (e.g., entries to A levels) or performance in level 3 maths and in maths-related subjects (e.g., achieving at least grade $A$ at $A$ level) via quantitative analysis of entries and performance data.
In particular, the main research question is:
How does overall performance in GCSE maths relate to progression and subsequent attainment in level 3 qualifications with mathematical content, preand post- GCSE reform?

It should be noted that alongside GCSE reform, A levels have also been reformed. For example, students who sat the reformed maths GCSE in 2017 (first year of assessments after the GCSE reform) were the first full cohort ${ }^{4}$ to sit the reformed maths and further maths A level in summer 2019.

[^1]
## Data and methods

## Data

This work addressed the research question via quantitative analysis of national results data available in the National Pupil Database.

The National Pupil Database (NPD) is a longitudinal database for children in schools in England, linking pupil characteristics to school and college learning aims and attainment. It holds individual pupil level attainment data for pupils in all schools and colleges who take part in the tests/exams and pupil and school characteristics (e.g., age, gender, ethnicity, special educational needs, eligibility for free school meals, etc.) sourced from the School Census for maintained schools only. The following extracts of the NPD data were used:

- Key Stage 4 Pupil \& Exam data, linked to Spring Census for the academic years 2014 to 2017
- Key Stage 5 Pupil \& Exam data, linked to Spring Census for the academic years 2016 to 2019
Candidates who completed a GCSE maths in each of the years in Table 1 below (June sessions only) were followed up for two years and data for level 3 qualifications in the four exam sessions before the end of Key Stage 5 were included. For example, students who achieved a GCSE maths in 2015 were followed up in 2016 and 2017 and their AS and A level results (in any November or June session in that period) identified.

Table 1: GCSE maths cohorts included in the research

| GCSE exam <br> year | A level <br> completion | GCSE maths |
| :--- | :--- | :--- |
| 2014 | 2016 | Legacy $\left(\mathrm{A}^{*}-\mathrm{G}\right)$ |
| 2015 | 2017 | Legacy $\left(\mathrm{A}^{*}-\mathrm{G}\right)$ |
| 2016 | 2018 | Legacy $\left(\mathrm{A}^{*}-\mathrm{G}\right)$ |
| 2017 | 2019 | Reformed $(9-1)$ |

The analyses were restricted to students who were 16 years old at the end of the academic year. This age restriction was made to have a set of "typical" candidates at the end of Key Stage 4. The numbers of students who achieved a GCSE Maths in each year from 2014 to 2017, together with the grade distributions, are available in Appendix A.

As shown in Table 1, the grades available in the period of study were in two different grade scales: $A^{*}-G$ for the legacy GCSE qualifications, and $9-1$ for the reformed GCSE. For some of the analysis in this study, the grades for pre- and post-reform GCSE maths were converted to a common numerical scale using the Department for Education's conversion values for 2017 and 2018 performance table calculations (DfE, 2016) as shown in Table 2 below.

Table 2: GCSE grade scales (pre- and post- GCSE reform)

| GCSE grade <br> common scale | GCSE grade <br> legacy | GCSE grade <br> reformed |
| :---: | :---: | :---: |
| 9 |  | 9 |
| 8.5 | A $^{*}$ |  |
| 8 |  | 8 |
| 7 | A | 7 |
| 6 |  | 6 |
| 5.5 | B |  |
| 5 | C | 5 |
| 4 | D | 4 |
| 3 | E | 2 |
| 2 | F |  |
| 1.5 | G | 1 |
| 1 | U | U |
| 0 |  |  |

Progression from GCSE maths to the following level 3 qualifications was investigated:

- A level maths
- Level 3 maths (any): this included AS level maths, A level maths, AS level further maths, A level further maths, and core maths
- Core maths ${ }^{5}$
- A level further maths
- Maths-related A level subjects (any): biology, chemistry, physics, economics, and psychology
- A level biology
- A level chemistry
- A level physics
- A level economics
- A level psychology

[^2]
## Method

Descriptive statistics on the number and proportion of GCSE maths students progressing to the qualifications listed above, pre-reform (2014-2016) and post-reform (2017) were produced. Progression was investigated overall and by GCSE grade.

Marginal grade distributions for all qualifications above, overall and for each GCSE maths grade, pre-and post-reform were also produced.

To further explore the effect of GCSE reform on progression to and performance in level 3 maths or maths-related subjects, while controlling for students' backgrounds, multilevel logistic regression analyses were carried out. The outcomes (dependent variables) of the regressions were as follows:

- progression to A level maths;
- progression to level 3 maths (any, core maths, A level further maths);
- progression to maths-related subject (any, biology, chemistry, physics, economics, and psychology);
- achievement of specific grade thresholds (e.g., at least grade A; at least grade C) in A level maths, core maths, A level further maths, and all A levels in the maths-related subjects listed above.

The independent variables in the regression models included: year the GCSE maths was achieved (this is an indicator of pre-reform (2014 to 2016) or post-reform (2017)), GCSE grade (using the common GCSE grade scale described in Table 2), gender, overall prior attainment, level of deprivation and school type.
The level of attainment at Key Stage 4 (prior attainment) was measured by the average GCSE and equivalents point score per entry (for details on how this is calculated, see DfE (2017)). The average GCSE and equivalents point score per entry ranges from 0 to 9 . This measure was used to divide students into three approximately equally sized groups: low attainment, medium attainment and high attainment. In each year, these terciles were based on the full Key Stage 4 cohort of students.

The level of income-related deprivation of the students was measured by the Income Deprivation Affecting Children Index (IDACI) ${ }^{6}$. This index is based on the student's home postcode and describes the percentage of children in a very small geographical area (Lower Layer Super Output Area or LSOA) living in low income families. It varies between 0 and 1 and indicates how income deprived the area in which a student lives is. It cannot, however, indicate how income deprived the student actually is. This measure was used to divide students into three approximately equally sized groups: low deprivation (more affluent), medium deprivation and high deprivation. As above, in each year, these terciles were based on the full Key Stage 4 cohort of students.

[^3]The NPD listed the centre at which candidates gained their Key Stage 4 qualifications, indicated by the centre's Unique Reference Number (URN). This number was used to match candidates to the Department for Education's register of educational establishments ${ }^{7}$, providing information on the type of school (Gill, 2017). Based on their type, schools were classified into five groups: comprehensive schools, secondary modern schools, independent schools, selective schools, and other ${ }^{8}$.
Note that some of the variables described above are collected as part of the annual school census, which is only compulsory for state-maintained schools (which do not include independent schools). This can lead to high levels of missing data among independent school students for some variables (e.g., IDACI deprivation).
With logistic regression models such as the ones fitted in this research, estimates are hard to interpret directly because they are log odds of the outcome (e.g., progressing to A level; achieving at least a grade A). But, in simple terms a positive parameter estimate (for a categorical variable) means that being in that category is associated with a higher probability compared to being in the reference category. Negative values mean a reduction in probability. A positive parameter estimate for a continuous variable means that the increase in that variable is associated with an increase in the probability of the outcome.

To aid interpretation, alongside the tables with the results from the regression analyses, figures are presented showing the probability of the outcome for different GCSE grades and broken down by the GCSE year.

Note: To ensure confidentiality of the data, statistical disclosure controls have been applied to the results (tables and graphs). In particular, counts below ten and percentages based on counts below ten have either been suppressed or merged with other counts.

[^4]
## Results

## Progression to A level maths

## Overall progression

Table 3 and Figure 1 (see Table B1 in Appendix B for more details) below show the overall progression to A level maths of students who achieved a GCSE in maths pre- and postreform. Progression to A level maths increased almost two percentage points post-reform. However, this increase could be a continuation of a trend already present pre-reform (Figure 1 shows that progression to $A$ level maths had been increasing year on year in the last three years prior to the GCSE reform).

Table 3: Overall progression to $A$ level maths, before and after the reform

|  | A level maths |  |  |
| :--- | :--- | ---: | ---: |
|  | Progression | N | $\%$ |
| Pre-reform <br> $(2014-2016)$ | No | 1423803 | 90.5 |
|  | Yes | 148915 | 9.5 |
| Post-reform <br> $(2017)$ | No | 470651 | 88.7 |
|  | Yes | 59831 | 11.3 |

Figure 1: Overall progression to A level maths, by GCSE year (pre-reform: 2014 to 2016; post-reform: 2017)

## Progression by GCSE grade

Table 4 shows the progression to A level maths broken down by achievement in GCSE maths, pre- and post-reform. Progression increased post-reform for all students, independently of the grade achieved at GCSE. However, the increase in progression rates was higher amongst those who achieved at least grade A/7 (+5.5 percentage points) than for students with at least grade $\mathrm{C} / 4$ ( +2.4 percentage points). Figure 2 (see Table B2 in Appendix B for more details) shows progression by GCSE year.

Table 4: Progression to $A$ level maths, by achievement of GCSE grade thresholds (A/7 or above; $\mathrm{C} / 4$ or above)

|  | GCSE <br> grade | GCSE | A level maths |  |
| :--- | :--- | ---: | ---: | ---: |
|  |  | N | $\%$ |  |
| Pre-reform <br> $(2014-2016)$ | $\mathrm{A} / 7$ or above | 293800 | 135846 | 46.2 |
|  | $\mathrm{C} / 4$ or above | 1100647 | 148656 | 13.5 |
| Post-reform <br> $(2017)$ | $\mathrm{A} / 7$ or above | 106759 | 55174 | 51.7 |
|  | $\mathrm{C} / 4$ or above | 376919 | 59822 | 15.9 |

Figure 2: Overall progression to A level maths, by GCSE year (pre-reform: 2014 to 2016; post-reform: 2017) and achievement of GCSE grade thresholds: A/7 or above and C/4 or above

Table 5 shows progression by the individual GCSE grade. It is clear that there is hardly any progression to A level maths amongst candidates who achieved grade C/4 or below, both pre- and post-reform. Progression at grade A/7 post-reform (GCSE year 2017) was very similar to progression in a couple of pre-reform years (GCSE years 2014 and 2015), although slightly lower than in the last pre-reform year (2016).

Table 5: Progression to A level maths, by individual GCSE grade

| GCSE year | GCSE grade | GCSE candidates | Progressing to A level |  |
| :---: | :---: | :---: | :---: | :---: |
|  |  |  | N | \% |
| 2014 | A* | 28043 | 20322 | 72.5 |
|  | A | 55386 | 16725 | 30.2 |
|  | B | 100264 | 3567 | 3.6 |
|  | C or below | 322269 | 77 | 0.0 |
| 2015 | A* | 39853 | 27189 | 68.2 |
|  | A | 66214 | 20445 | 30.9 |
|  | B | 110379 | 4297 | 3.9 |
|  | C or below | 328538 | 107 | 0.1 |
| 2016 | A* | 37179 | 27891 | 75.0 |
|  | A | 67125 | 23274 | 34.7 |
|  | B | 109433 | 4946 | 4.5 |
|  | C or below | 308035 | 75 | 0.0 |
| 2017 | 9 | 19145 | 16720 | 87.3 |
|  | 8 | 35877 | 22572 | 62.9 |
|  | 7 | 51737 | 15882 | 30.7 |
|  | 6 | 59036 | 4217 | 7.1 |
|  | 5 | 99787 | 410 | 0.4 |
|  | 4 or below | 264900 | 30 | 0.0 |

## Performance in A level maths

Figure 3 (Table B3 in Appendix B) shows the A level maths grade distribution for the cohorts of students progressing to A level maths who achieved a GCSE in 2014 to 2016 (pre-reform) and in 2017 (post-reform). Compared to the last year pre-reform (2016), students who achieved a GCSE maths post-reform (2017) were more likely to achieve an A* grade at A level, but they were less likely to achieve grades A or B. On the contrary, the percentages of students achieving grade $D$ or $E$ at $A$ level were higher post-reform.
Table 6 offers a more detailed view of the A level maths grade distribution pre- and postreform, breaking it down by GCSE grade. Only progression from GCSE grade C / 5 or above is shown, as the numbers of candidates progressing to $A$ level maths with a GCSE grade below C (2014-2016) or 5 (2017) were very small. Looking at GCSE students who achieved, for example, grade A/7, Table 6 shows that there were lower proportions of candidates achieving grades $\mathrm{A}^{*}$ to B post-reform than pre-reform.

Figure 3: A level maths grade distribution, by GCSE year (students progressing from GCSE maths)

Table 6: A level maths grade distribution, by GCSE year and GCSE maths grade (C / 5 or above) ${ }^{9}$

| GCSE <br> year | GCSE grade | A level Maths grade |  |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  |  | * | A | B | C | D | E | U |
| 2014 | A* | 27.1 | 34.1 | 22.3 | 10.3 | 4.1 | 1.7 | 0.4 |
|  | A | 4.0 | 13.0 | 26.1 | 24.7 | 18.6 | 10.0 | 3.6 |
|  | B | 1.3 | 4.1 | 14.3 | 22.5 | 25.3 | 21.0 | 11.5 |

[^5]
## Regression analysis

As described on Page 13, to further explore the effect of GCSE reform on progression to and performance in A level maths, controlling for students' backgrounds (e.g., gender; overall prior attainment; level of deprivation; school type), multilevel logistic regression analyses were carried out.

The outcomes (dependent variables) of the regression models were as follows:

- progression to A level maths
- achievement of specific grade thresholds in A level maths (at least grade A; at least grade C).
Table 7 shows the results of the regression model looking at progression to $A$ level maths and Figure 4 (using data from Table 7) shows the probability of progressing to A level maths for a female student, of medium prior attainment, of medium level of deprivation, and in a comprehensive school.

Table 7: Progression to A level maths, regression analysis results ( $\mathrm{N}=1761038$ )

| Variable |  | Estimate | Standard Error | $\mathrm{Pr}>\|\mathrm{t}\|$ |
| :---: | :---: | :---: | :---: | :---: |
| Intercept |  | -16.361 | 0.073 | <. 0001 |
| Gender | Male | 0.951 | 0.008 | <. 0001 |
|  | [Female] |  |  |  |
| Deprivation | Medium | 0.005 | 0.009 | 0.5890 |
|  | High | 0.087 | 0.012 | <. 0001 |
|  | [Low] |  |  |  |
| Prior attainment | Medium | 2.827 | 0.050 | <. 0001 |
|  | High | 3.432 | 0.048 | <. 0001 |
|  | [Low] |  |  |  |
| School Type | Independent | -1.028 | 0.594 | 0.0836 |
|  | Other | -0.259 | 0.143 | 0.0706 |
|  | Secondary Modern | -0.057 | 0.059 | 0.3357 |
|  | Selective | -0.160 | 0.045 | 0.0004 |
|  | [Comprehensive] |  |  |  |
| GCSE Maths Grade |  | 1.641 | 0.007 | <. 0001 |
| GCSE Exam Year | 2014 | 1.041 | 0.075 | $<.0001$ |
|  | 2015 | 1.237 | 0.071 | <. 0001 |
|  | 2016 | 1.557 | 0.069 | <. 0001 |
|  | 2017 |  |  |  |
| GCSE Maths Grade GCSE Exam Year | 2014 | -0.151 | 0.011 | <. 0001 |
|  | 2015 | -0.166 | 0.010 | <. 0001 |
|  | 2016 | -0.190 | 0.010 | <. 0001 |
|  | 2017 |  |  |  |

Table 7 shows that the year the GCSE was taken was a statistically significant predictor of progression to A level maths, and its effect varied (significantly) by grade. For example:

- A candidate with grade 4 in GCSE maths, had a very similar (and very low) probability of progression pre- and post-reform: a probability of 0.01 to progress to $A$
level maths pre-reform (taking 2015 as an example, but very similar for the other prereform years) and a probability of 0.01 after the reform.
- A candidate with grade 7 in GCSE maths, had similar probability of progression preand post-reform: a probability of 0.12 to progress to $A$ level maths pre-reform (as above, in 2015) and a probability of 0.11 after the reform.
- However, the very top candidates had different probability of progression pre- and post- reform: a candidate with grade $A^{*}$ pre-reform (2015, $A^{*}=8.5$ ) had a probability of progression of 0.56 , whilst candidates with grade 9 post-reform had a probability of 0.78 .

It is important to note that, although we are reporting progression rates for the top candidates before and after the reform (grade A* candidates vs. grade 9 candidates), grades $A^{*}$ and 9 are not comparable and, on average, the top candidates were "better" post-reform (see Table 2).

Figure 4 corroborates the above, showing that towards the top of the GCSE distribution, the progression to A level becomes very slightly higher for students who achieved the GCSE in 2017 (post-reform).

GCSE year - 2014 - ㄴ. 2015 - A- 2016 - 2017
Figure 4: Probability of progression to A level maths, by GCSE year and GCSE maths grade (Gender=Female; Prior attainment=Medium; Deprivation=Medium; School type=Comprehensive)

Table 8 shows the results of the regression analyses looking at the performance in A level maths (i.e., achieving at least grade A; achieving at least grade C) pre- and post-reform.

Table 8: Achievement of grade thresholds in A level maths, regression analysis results ( $N=176398$ )

|  | 2017 |  |  |  | 0.000 |  |  |
| GCSE Maths Grade GCSE Exam Year | 2014 | -0.528 | 0.024 | <. 0001 | -0.446 | 0.023 | <. 0001 |
|  | 2015 | -0.482 | 0.023 | $<.0001$ | -0.441 | 0.021 | $<.0001$ |
|  | 2016 | -0.462 | 0.022 | <. 0001 | -0.409 | 0.021 | <. 0001 |
|  | 2017 | . |  | . | . |  |  |

As for progression to A level maths, the year the GCSE was taken was a statistically significant predictor of performance in A level maths, and its effect varied (significantly) by grade. In particular, both Table 8 and Figure 5 below show that the probability of achieving at least grade A or at least grade C at A level was lower post-reform (2017) than pre-reform (2014-2016), apart from for the students who achieved the top GCSE grades. In particular:

- A candidate with grade 7 in GCSE maths, had a higher probability of achieving at least a grade $A$ at A level pre-reform than post-reform: a probability of 0.06 prereform (taking 2015 as an example, but very similar for the other pre-reform years) and a probability of 0.03 after the reform. However, top candidates had a lower probability of achieving at least a grade $A$ at A level pre-reform: a candidate with grade $A^{*}$ pre-reform (2015, $A^{*}=8.5$ ) had a probability of 0.31 , whilst candidates with grade 9 post-reform had a probability of 0.52 .
- Similarly, a candidate with grade 7 in GCSE maths, had a higher probability of achieving at least a grade C at A level pre-reform than post-reform: a probability of 0.47 pre-reform (taking 2015 as an example, but very similar for the other pre-reform years) and a probability of 0.32 after the reform. However, top candidates had a lower probability of achieving at least a grade A at A level pre-reform: a candidate with grade $\mathrm{A}^{*}$ pre-reform (2015, $\mathrm{A}^{*}=8.5$ ) had a probability of 0.79 , whilst candidates with grade 9 post-reform had a probability of 0.89 .

As mentioned above, although we are reporting progression rates for the top candidates before and after the reform (grade $\mathrm{A}^{*}$ candidates vs. grade 9 candidates), grades $\mathrm{A}^{*}$ and 9 are not comparable and, on average, the top candidates were "better" post-reform (see Table 2).

Figure 5: Probability of achieving a grade or above in A level maths, by GCSE year and GCSE maths grade (Gender=Female; Prior attainment=Medium; Deprivation=Medium; School type=Comprehensive)

## Progression to level 3 maths qualifications

In this section, progression from GCSE maths to any level 3 maths qualification was investigated. The category "any level 3 maths" includes the following qualifications:

- A level maths
- AS level maths
- A level further maths
- AS level further maths
- Core maths

Alongside results for "any level 3 maths" qualifications, progression to and performance in A level further maths and core maths are reported separately.

## Overall progression

Table 9 and Figure 6 (see Table C1 in Appendix C for more details) below show the overall progression to any level 3 maths qualifications of students who achieved a GCSE in maths pre- and post-reform.
Progression to any level 3 maths qualifications was slightly lower post-reform (just two percentage points lower). This could be due, in part, to the decrease in uptake of the AS in maths and further maths in 2019, the first year of the AS/A level maths reform (Ofqual, 2019).

Table 9: Overall progression to level 3 maths qualifications, before and after the reform

|  | Progression | Any level 3 maths |  | Core maths |  | A level further maths |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  |  | N | \% | N | \% | N | \% |
| Pre-reform$(2014-2016)$ | No | 1332976 | 84.8 | 1564233 | 99.5 | 1549757 | 98.5 |
|  | Yes | 239742 | 15.2 | 8485 | 0.5 | 22961 | 1.5 |
| Post-reform (2017) | No | 459752 | 86.7 | 525400 | 99.0 | 521135 | 98.2 |
|  | Yes | 70730 | 13.3 | 5082 | 1.0 | 9347 | 1.8 |

Table 9 also shows progression to core maths and A level further maths, specifically. In both cases, there is higher progression post-reform (although progression is low both pre- and post-reform). This is confirmed by the trends shown in Figure 7(a) for core maths and Figure 7(b) for the A level in further maths. Data for these graphs is given in Table C2 in Appendix C.

Figure 6: Overall progression to any level 3 maths qualification, by GCSE year (pre-reform: 2014 to 2016; post-reform: 2017)

Figure 7: Overall progression to level 3 maths qualifications, by GCSE year (pre-reform: 2014 to 2016; post-reform: 2017)

## Progression by GCSE grade

Any level 3 maths qualification
Table 10 and Figure 8 (see Table C3 in Appendix C for more details) show the progression to any level 3 maths qualification broken down by achievement in the GCSE, pre- and postreform. Progression decreased post-reform, independently of the grade achieved by the students in their GCSEs.

Table 11 shows progression by the individual GCSE grade. There was very low progression to level 3 maths qualifications amongst candidates who achieved grade $\mathrm{C} / 4$ or below, both pre- and post-reform. Table 11 also shows that progression decreased at all GCSE grades.

Table 10: Progression to any level 3 maths qualifications, by achievement of GCSE grade thresholds (A/7 or above; C/4 or above)

|  | GCSE <br> grade | GCSE | Level 3 maths (any) |  |
| :--- | :--- | ---: | ---: | ---: |
|  |  | N | $\%$ |  |
| Pre-reform <br> $(2014-2016)$ | $\mathrm{A} / 7$ or above | 293800 | 189944 | 64.7 |
|  | $\mathrm{C} / 4$ or above | 1100647 | 234831 | 21.3 |
| Post-reform <br> $(2017)$ | $\mathrm{A} / 7$ or above | 106759 | 60464 | 56.6 |
|  | $\mathrm{C} / 4$ or above | 376919 | 70688 | 18.8 |

Figure 8: Overall progression to any level 3 maths qualifications, by GCSE year (pre-reform: 2014 to 2016; post-reform: 2017) and achievement of GCSE grade thresholds: A/7 or above and $\mathrm{C} / 4$ or above

Table 11: Progression to any level 3 maths qualification, by individual GCSE grade

| GCSE year | GCSE grade | GCSE candidates | Progressing to level 3 maths (any) |  |
| :---: | :---: | :---: | :---: | :---: |
|  |  |  | N | \% |

|  | 7 | 51737 | 19277 | 37.3 |
|  | 6 | 59036 | 7091 | 12.0 |
|  | 5 | 99787 | 2437 | 2.4 |
|  | 4 or below | 111337 | 696 | 0.6 |

## Core maths and A level further maths

Table 12 and Figure 9 (see Table C4 in Appendix C for more details) show the progression to core maths and A level further maths broken down by achievement in the GCSE, pre- and post-reform. Progression to both core maths and A level further maths increased postreform, independently of the grade achieved by the students in their GCSEs. In core maths, the increase was slightly lower amongst students who achieved at least grade A/7 than amongst students who achieved at least grade C/4 (+0.6 vs. +0.8 percentage points), whilst the opposite pattern was found for A level maths ( $+0.9 \mathrm{vs} .+0.4$ percentage points).
Progression to core maths and further maths by the individual GCSE grade is available in Table C5 in Appendix C.

Table 12: Progression to core maths and A level further maths, by achievement of GCSE grade thresholds (A/7 or above; C/4 or above)

|  | GCSE <br> grade | GCSE |  | Core maths |  | A level <br> further maths |  |
| :--- | :--- | ---: | ---: | ---: | ---: | ---: | :---: |
|  |  | N | N | $\%$ | N | $\%$ |  |
| Pre-reform <br> $(2014-2016)$ | $\mathrm{A} / 7$ or above | 293800 | 1482 | 0.5 | 22843 | 7.8 |  |
|  | $\mathrm{C} / 4$ or above | 1100647 | 5666 | 0.5 | 22954 | 2.1 |  |
| Post-reform <br> $(2017)$ | $\mathrm{A} / 7$ or above | 106759 | 1168 | 1.1 | 9325 | 8.7 |  |
|  | $\mathrm{C} / 4$ or above | 376919 | 5052 | 1.3 | 9346 | 2.5 |  |

Figure 9: Overall progression to specific level 3 maths qualifications, by GCSE year (prereform: 2014 to 2016; post-reform: 2017) and achievement of GCSE grade thresholds

## Performance in level 3 maths qualifications

Figure 10(a) (Table C6 in Appendix C) shows the core maths grade distribution for the cohorts of students progressing to core maths who achieved a GCSE in 2014 to 2016 (prereform) and in 2017 (post-reform). Compared to the pre-reform years (2014-2016), students who achieved a GCSE maths post-reform (2017) were more likely to achieve a grade A or a grade $B$ in core maths. On the contrary, the percentages of students achieving grade D or E in core maths were lower post-reform. The percentage of students with grade $U$ was also higher pre-reform.

Similarly, Figure 10(b) (Table C7 in Appendix C) shows the A level further maths grade distribution. In this case, compared to the pre-reform years (2014-2016), students who achieved a GCSE maths post-reform (2017) were less likely to achieve a grade A* or a grade A in A level further maths. On the contrary, the percentages of students achieving lower grades in A level further maths (e.g., C or D ) were higher post-reform.

Figure 10: Grade distribution in level 3 Maths qualifications, by GCSE year (students progressing from GCSE maths)

Table 13 and Table 14 offer a more detailed view of the core maths and A level further maths grade distribution pre- and post-reform, breaking it down by GCSE grade. Note that only the achievement of grade thresholds (at least grade A; grade C or above) is shown.
For core maths, and looking at GCSE students who achieved, for example, grade A/7 in their maths GCSE, Table 13 shows that there were higher proportions of candidates achieving grade A in core maths post-reform than pre-reform.
For A level further maths, there was hardly any progression amongst candidates with a GCSE below grade A/7 (Table C5 in Appendix C). For candidates with up to and including a grade A/7 at GCSE, Table 14 shows that the percentage of students achieving at least grade A in A level further maths was lower post-reform. Table 14 also shows that the percentage of these students achieving at least grade C in A level further maths was also lower post-reform.

Table 13: Achievement of grade thresholds in core maths, by GCSE year and GCSE Maths grade

| GCSE year | GCSE grade | Progressing to core maths | Core maths grade |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  |  |  | Grade A |  | Grade C or above |  |
|  |  |  | N | \% | N | \% |

## Regression analysis

Table 15 shows the results of the regression model looking at progression to any level 3 maths qualifications and Figure 11 (using data from Table 15) shows the probability of progressing to any level 3 maths qualification for a female student, of medium prior attainment, of medium level of deprivation, and in a comprehensive school.

Table 15 shows that the year the GCSE was taken was a statistically significant predictor of progression to any level 3 maths qualification, and its effect varied (significantly) by grade. For example:

- A candidate with grade 4 in GCSE maths, had a very similar (and very low) probability of progression pre- and post-reform.
- A candidate with grade 7 in GCSE maths, however, had lower probability of progression post-reform: a probability of 0.42 to progress to any level 3 maths qualification pre-reform (in 2015 as an example, but very similar for other pre-reform years) and a probability of 0.24 after the reform.
Figure 11 corroborates the above, showing that the probability of progression, although varying slightly by grade, was lower post-reform.

The results of the regression models looking, specifically, at progression to core maths and A level further maths are available in Tables C8 and C9 in Appendix C. In general, they support the results showed in Table 12 and Figure 9.

Table 15: Progression to any level 3 maths qualifications, regression analysis results ( $\mathrm{N}=$ 1761038)

Figure 11: Probability of progression to any level 3 maths qualifications, by GCSE year and GCSE maths grade (Gender=Female; Prior attainment=Medium; Deprivation=Medium; School type=Comprehensive)

Figure 12 and Figure 13 below summarise the results of the regression analyses looking at the performance in core maths and in A level further maths (i.e., probabilities of achieving specific thresholds) pre- and post-reform. Full results from the regression analyses are available in Tables C10 (core maths) and C11 (A level further maths), Appendix C.

Figure 12: Probability of achieving a grade or above in core maths, by GCSE year and GCSE maths grade (Gender=Female; Prior attainment=High; Deprivation=Medium; School type=Comprehensive)

Figure 13: Probability of achieving a grade or above in A level further maths, by GCSE year and GCSE maths grade (Gender=Male; Prior attainment=High; Deprivation=Medium; School type=Comprehensive)

For core maths, Figure 12 shows that the probability of achieving a grade A in core maths was similar pre- and post-reform for students with a GCSE maths grade below B. However, this probability was higher post-reform for students with top grades at GCSE. Achievement of grade C or above was lower post-reform for students with a GCSE maths grade below B , and similar pre- and post-reform for students with top GSCE grades.
For A level further maths, Figure 13 shows that the probability of achieving both grade A or above and grade C or above was lower post-reform than pre-reform across the GCSE grade range.

## Progression to maths-related qualifications

In this section, progression from GCSE maths to level 3 maths-related qualifications was investigated. As described in the data and methods section, the category "maths-related" qualifications includes the following qualifications:

- A level biology
- A level chemistry
- A level physics
- A level economics
- A level psychology

Alongside results for progression to "any maths-related" qualifications, progression to and performance in each of the above $A$ level subjects is reported separately.

## Overall progression

Table 16, Figure 14 and Figure 15 (see Tables D2 and D4, respectively, in Appendix D for more details) show the progression to maths-related qualifications of students who achieved a GCSE in maths pre- and post-reform. These tables and figures show that progression to any maths-related subject was higher post-reform, overall and in each of the five A level subjects considered in this work. The difference between progression pre- and post-reform was highest in biology and chemistry ( +2.1 percentage points) and lowest in economics (+0.5 percentage points).
For context, we also looked at progression to some non-maths-related subjects at A level (history, English literature, religious studies, sociology, and geography). Progression to A level in English literature and religious studies was generally lower post-reform. On the contrary, progression to history, sociology and geography was slightly higher post-reform. Differences between pre- and post- reform progression rates for these subjects were small, between 0.4 and 0.8 percentage points (these differences were smaller than for the science subjects in Table 16). Details of the analyses looking at progression to non-maths-related subjects can be found in Appendix E.

Table 16: Overall progression (\%) to maths-related subjects, before and after the reform (Number of students in Table D1, Appendix D)

| GCSE | Progression | Maths-related subjects (\%) |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  |  | Any subject | Biology | Chemistry | Physics | Economics | Psychology |
| Pre-reform$(2014-2016)$ | No | 79.8 | 92.7 | 94.3 | 96.1 | 96.6 | 91.5 |
|  | Yes | 20.2 | 7.3 | 5.7 | 3.9 | 3.4 | 8.5 |
| Post-reform (2017) | No | 75.7 | 90.6 | 92.2 | 94.9 | 96.1 | 90.2 |
|  | Yes | 24.3 | 9.4 | 7.8 | 5.1 | 3.9 | 9.8 |

Figure 14: Overall progression to any maths-related A level subject, by GCSE year (prereform: 2014 to 2016; post-reform: 2017)

Figure 15: Overall progression to maths-related subjects, by GCSE year (pre-reform: 2014 to 2016; post-reform: 2017)

## Progression by GCSE grade

## Any maths-related qualification

Table 17, Figure 16 and Figure 17 (see Tables D6 and D8, respectively, in Appendix D for more details) show the progression to maths-related qualifications broken down by achievement in the GCSE, pre- and post-reform.

Table 17: Progression to maths-related qualifications, by achievement of GCSE grade thresholds (Number of students in Table D5, Appendix D)

| GCSE year | GCSE | Any <br> subject | Biology | Chemistry | Physics | Economics | Psychology |
| :--- | :--- | ---: | ---: | ---: | ---: | ---: | ---: |
| Pre-reform <br> $(2014-2016)$ | A / 7 or above | 61.1 | 25.5 | 24.5 | 18.0 | 10.9 | 14.6 |
|  | C / 4 or above | 25.1 | 9.8 | 8.0 | 5.5 | 4.5 | 9.0 |
| Post-reform <br> $(2017)$ | A /7 or above | 68.0 | 29.1 | 29.9 | 21.9 | 11.6 | 14.8 |
|  | C $/ 4$ or above | 34.0 | 13.2 | 10.9 | 7.2 | 5.4 | 13.6 |

Figure 16: Overall progression to maths-related subjects, by GCSE year (pre-reform: 2014 to 2016; post-reform: 2017) and achievement of GCSE grade thresholds

Figure 17: Overall progression to maths-related subjects, by GCSE year (pre-reform: 2014 to 2016; post-reform: 2017) and achievement of GCSE grade thresholds

For all A level qualifications, progression increased post-reform for students who achieved at least grade $A / 7$ in their GCSE maths. The highest increase in progression was for chemistry and physics ( +5.4 and +3.9 percentage points, respectively) and the lowest increase was in psychology ( +0.2 percentage points).
For students who achieved a grade $\mathrm{C} / 4$ or above, progression was also higher post-reform. The biggest increase was in psychology, followed by biology ( +4.6 and +3.4 percentage points, respectively).

Progression to maths-related qualifications by individual grade can be found in Appendix D (Tables D9 to D11).

## Performance in maths-related qualifications

Figure 18 (and Tables D12 and D16 in Appendix D) shows the grade distribution in five maths-related A level subjects for the cohorts of students who achieved a GCSE in 2014 to 2016 (pre-reform) and in 2017 (post-reform).

Compared to the pre-reform years Figure 18 shows that, in general, performance in mathsrelated subjects was worse post-reform. In particular, the percentages of students achieving good grades ( $A^{*}, A$ and $B$ - with the exception of physics at grade $B$ ) were lower for students who achieved their GCSEs in 2017 (post-reform) than for students who achieved the qualification in previous years (2014-2016, pre-reform).
Table 18 and Table 19 offer a more detailed view of the grade distribution for the mathsrelated A level subjects pre- and post-reform, breaking it down by GCSE grade. Note that only the achievement of grade thresholds (at least grade A; at least grade C) is shown.

Figure 18: Grade distribution in specific maths-related A levels, by GCSE year (students progressing from GCSE maths)

Table 18: Achievement of grade A or above in maths-related subjects, by GCSE year and GCSE maths grade (percentages were calculated using figures on progression to each subject, by GCSE grade, available in Table D10, Appendix D).

| GCSE year | GCSE <br> grade | Biology |  | Chemistry |  | Physics |  | Economics |  | Psychology |  |

## Regression analysis

To further explore the effect of GCSE reform on progression to and performance in mathsrelated qualifications, controlling for students' backgrounds (e.g., gender; overall prior attainment; level of deprivation; school type), multilevel logistic regression analyses were carried out.

Table D17 in Appendix D shows the results of the regression model looking at progression to any maths-related qualifications and Tables D18 to D22 show the results of the models looking at progression to specific maths-related A level subjects. In all regression models, the year the GCSE was taken was a statistically significant predictor of progression, and its effect varied (significantly) by grade.
Figure 19 and Figure 20 (using data from the above tables) show the probability of progressing to any maths-related qualifications and individual A level subjects, for the "typical" student taking the qualification. Note that, when looking at the probability graphs in Figure 20, the Y -axis scale is not always the same.

These figures show that progression to any maths-related subject was higher post-reform, overall and in each of the five A level subjects considered in this work. This confirms the results from the descriptive analyses shown earlier. Note that, although progression to psychology was generally higher post-reform than pre-reform, it decreased with increasing GCSE maths grade in 2016 and 2017.

Figure 19: Probability of progression to any maths-related subject, by GCSE year and GCSE maths grade (Gender=Female; Prior attainment=Medium; Deprivation=Medium; School type=Comprehensive)

Figure 20: Probability of progression to math-related subjects, by GCSE year and GCSE maths grade (for the "typical" student) ${ }^{10}$
${ }^{10}$ Biology and Chemistry: Female; Prior attainment=High; Deprivation=Low; Comprehensive school Physics: Male; Prior attainment=High; Deprivation=Low; Comprehensive school Economics: Male; Prior attainment=High; Deprivation=Medium; comprehensive school Psychology: Female; Prior attainment=High; Deprivation=Medium; Comprehensive school

Figure 21 to Figure 25 below summarise the results of the regression analyses looking at the performance in the different maths-related A levels (i.e., probabilities of achieving specific thresholds) pre- and post-reform. The results of the regression models, from which the figures are derived, are presented in Tables D23 to D27 in Appendix D.
In all regression models, the year the GCSE was taken was a statistically significant predictor of performance, and its effect varied (significantly) by grade. In particular, as already shown by the descriptives analyses reported in the previous section, compared to the pre-reform years these figures show that, in general, performance in maths-related subjects was worse post-reform.

If we look at Figure 21 to Figure 23 (performance in A levels in biology, chemistry and physics) in a bit more detail, we can see that performance was very similar pre- and postreform for students with the very top GCSE grades (with the exception of physics at grade A or above), but it was lower post-reform for students with lower grades in GCSE maths.
Figure 24 and Figure 25 show that performance in economics and psychology, although statistically significant different pre- and post-reform, was fairly similar in practice (both at grade A or above and at grade C or above).

Figure 21: Probability of achieving a grade or above in A level Biology, by GCSE year and GCSE maths grade (Gender=Female; Prior attainment=High; Deprivation=Low; School type=Comprehensive)

Figure 22: Probability of achieving a grade or above in A level Chemistry, by GCSE year and GCSE maths grade (Gender=Female; Prior attainment=High; Deprivation=Low; School type=Comprehensive)

Figure 23: Probability of achieving a grade or above in A level Physics, by GCSE year and GCSE maths grade (Gender=Male; Prior attainment=High; Deprivation=Low; School type=Comprehensive)

Figure 24: Probability of achieving a grade or above in A level Economics, by GCSE year and GCSE maths grade (Gender=Male; Prior attainment=High; Deprivation=Medium; School type=Comprehensive)

Figure 25: Probability of achieving a grade or above in A level Psychology, by GCSE year and GCSE maths grade (Gender=Female; Prior attainment=High; Deprivation=Medium; School type=Comprehensive)

## Conclusions and discussion

This research has explored how well GCSE maths prepared young people for further study in mathematics and subjects with significant mathematical content in the context of GCSE reform. In the sections that follow, the findings of the research are summarised and discussed.

## Progression to A level maths

Contrary to fears of reduction in the uptake of A level maths following the reform (e.g., Lee et al., 2018; Redmond et al., 2020) this research showed that progression generally increased post-reform. However, when breaking it down by the grade achieved in GCSE maths, the increase in progression was higher amongst those who achieved at least grade A/7 than for students with at least grade C/4.
Performance in A level maths was, in general, lower post-reform. In particular, the probability of achieving at least grade A or at least grade C in A level maths was lower post-reform for students with any GCSE grade, apart from the students at the very top of the GCSE grade distribution. This contrasts with the perceptions of A level maths teachers interviewed in research by Howard and Khan (2019) or Humphries at al. (2017), who commented that the reformed GCSE prepared students for the A level at least as well, if not better, than the legacy GCSE and that students sitting the reformed GCSE would be leaving Key Stage 4 with more mathematical knowledge that previous cohorts. However, it should be taken into account that students taking the reformed GCSE would have also taken the newly reformed A level in maths, and it is well known that student performance tends to dip slightly in the first years of a new qualification (i.e., there is a sawtooth effect, as described, for example, in Cuff et al. (2019)). Whilst the approach to awarding and grading A levels in this context (comparable outcomes (Newton, 2020)) should have smoothed the sawtooth effect when looking at grade distributions, there could still be some evidence of relative underperformance. Furthermore, research showed that the reformed A level specifications were significantly more demanding than legacy specifications (Redmond et al., 2020), and there was concern from some teachers that while more able students may benefit from the more "aspirational" A level, lower performing students may be impacted negatively by the changes.

## Progression to level 3 maths

Progression to level 3 maths (which included progression to AS level qualifications in maths and further maths, as well as progression to the A levels in those subjects) decreased postreform. This decrease was present across the full GCSE grade range. A likely explanation of this result (in view of the increased progression to $A$ level maths described above) is the decrease in the uptake of AS in maths in further maths in 2019, possibly due to A level reform and the decoupling of AS and A levels (see, for example, DfE (2020b) for evidence of the sharp decline of AS qualifications in recent years).
Progression to individual level 3 maths qualifications such as core maths or A level further maths increased post-reform (although it should be noted that progression to either of these qualifications was quite low both pre- and post-reform). In the case of core maths, as
suggested by Mathieson et al. (2020), this increase can be seen as the result of the opportunity that this subject provides students for whom there was previously no option to study maths post-16. There were, however, differences in progression by the grade achieved in GCSE maths: the increase was slightly lower amongst students who achieved at least grade A/7 than amongst students who achieved at least grade C/4 in core maths, whilst the opposite pattern was found for A level maths.
Regarding performance in core maths and $A$ level further maths, compared to the pre-reform years, students who achieved a GCSE maths post-reform were more likely to achieve top grades (grades A or B) in core maths. On the contrary, compared to the pre-reform years, students who achieved a GCSE maths post-reform were less likely to achieve both grade A or above and grade C or above in A level further maths.

## Progression to maths-related A level subjects

Howard and Khan (2019) reported that the reformed GCSE had positive implications beyond studying A level maths and that the new GCSE would support students' progression to and performance in other subjects with mathematical content. This research investigated the impact of GCSE maths reform on five maths-related A levels (biology, chemistry, physics, economics and psychology) and found that overall progression was higher post-reform in all subjects.
Compared to the pre-reform years, performance in maths-related subjects was generally worse post-reform. In particular, the A level science subjects (biology, chemistry and physics) performance was very similar pre- and post-reform for students with the very top GCSE grades in maths, but it was lower post-reform for students with lower grades in GCSE maths. However, in economics and psychology, performance was very similar pre- and postreform.

This research is set in the context of recent reforms to GCSEs and A levels and, as with any reforms, changes take time to bed in. Given that this research focussed on the first year after the reform (the new GCSE maths was first assessed in 2017), it is possible that the results do not reflect how the reformed GCSE maths will impact progression to and performance in level 3 maths and maths-related subjects over the coming years.

[^0]:    ${ }^{1}$ Students taking the A level maths in 2019 would have studied the reformed GCSE maths.

[^1]:    ${ }^{2}$ MEI - Mathematics in Education and Industry (https://mei.org.uk/).
    ${ }^{3}$ This percentage ( $52 \%$ of the marks required for grade 7) was lower post-reform (in 2019) than in pre-reform years. However, it should be born in mind that grade boundaries in the first year(s) of reformed qualifications, as it is the case here, are usually lower than in pre-reform years and they gradually increase and stabilise over time to account for candidates' drop in performance (Cuff et al., 2019).
    ${ }^{4}$ A level maths was available after one year of study in summer 2018. The entries in summer 2018 were small and were mainly year 12 students also studying A level further maths.

[^2]:    ${ }^{5}$ Core maths is a level 3 qualification aimed at students who have passed GCSE maths at grade 4 or above, but who have not chosen to study AS/A level maths. It helps students consolidate and extend their maths knowledge and provides them with transferable mathematical skills to support their other level 3 subjects (e.g., psychology, geography, business-related courses, sports, and social sciences, ...) and their transition to employment and further study. For more details see, for example, https://www.ocr.org.uk/qualifications/core-maths/.

[^3]:    ${ }^{6}$ For further information on IDACI calculation, including definitions of children, families, and income deprivation, see https://www.gov.uk/government/publications/english-indices-of-deprivation-2015-technical-report.

[^4]:    7 https://get-information-schools.service.gov.uk/.
    ${ }^{8}$ Comprehensive and secondary modern schools (which include free schools and academies) do not select their intake on the basis of academic achievement or the wealth of the parents of the students they accept. Selective schools are state-funded schools that admit students on the basis of some sort of selection criteria, usually academic. Independent schools are fee-charging private schools, independent from many of the regulations and conditions that apply to state-funded schools. Other schools included, for example, sixth form and further education colleges, special schools, pupil referral units, tutorial colleges, and training centres.

[^5]:    ${ }^{9}$ Counts from which percentages were calculated are given in Table B4 in Appendix B. Note that some cells have been combined to comply with the statistical disclosure controls.

[^6]:    ${ }^{11}$ Female; Prior attainment=high; deprivation=low; comprehensive school.
